Subject: April 2014 VI Memo

Troy –
Thanks for your time in meeting with us last Friday. After further consideration, Ecology has no concerns with your April 11, 2014 soil-to-indoor air pathway (VI) memo. Please feel free to reference this memo in the upcoming RI/FS Report.
We also appreciate your willingness to change the date for groundwater sampling to later in the month. How soon will we receive the draft RI/FS Report?
Thanks,
Steve

subject: TPH-G and Total Naphthalenes Screening Level Exceedances for the Soil-to-Indoor Air Pathway East Bay Redevelopment Site, Agreed Order DE5471, Ecology Facility/Site No. 6785176

The soil-to-indoor air pathway is a potentially complete exposure pathway at the East Bay Redevelopment Site (Site). Total petroleum hydrocarbons in the gasoline range (TPH-G) and total naphthalenes concentrations in Site soil pose a potential concern for the soil-to-indoor air pathway (PIONEER Technologies Corporation [PIONEER] 2013c; Washington State Department of Ecology [Ecology] 2013b, 2013c). The purpose of this memorandum is to present the locations where there are exceedances of soil-to-indoor air screening levels (SLs) for TPH-G and total naphthalenes that will need to be remedied pursuant to the pending Remedial Investigation/Feasibility Study (RI/FS) report. This memorandum will be included as an appendix in the RI/FS report.

1 Background

The approximately 15-acre Site is located in Olympia, Washington, on the southeast corner of the Port of Olympia peninsula adjacent to the East Bay of Budd Inlet. This Model Toxics Control Act (MTCA) Site is currently being addressed under Agreed Order DE5471. The soil-to-indoor air pathway, which addresses the potential migration of volatile constituents from subsurface soil to indoor air, is a pathway being evaluated at this Site.[1] The following is a chronological summary of key developments in the evaluation of the soil-to-indoor air pathway:

- A 2012 screening evaluation determined that TPH-G was the only constituent of interest that exceeded MTCA default soil SLs for the soil-to-indoor air pathway (PIONEER 2012).[2] The only TPH-G SL exceedances were at soil sampling locations DP06, DP24, and MW19. The 2012 screening evaluation concluded that further consideration of the soil-to-indoor air pathway was not necessary in accordance with Washington Administrative Code (WAC) 173-340-740(3)(b)(iii)(C) since the TPH-G soil concentrations at these three locations were not significantly higher than the MTCA default SL (PIONEER 2012).
- Ecology requested collection of additional soil and/or soil gas data to further support the conclusion reached in the 2012 screening evaluation (Ecology 2012).
- A data gap work plan was prepared to collect soil and soil gas samples from the two locations with the highest TPH-G concentrations in soil (PIONEER 2013a; Ecology 2013a). Soil sample locations SVP-1SO and SVP-2SO were co-located with MW19 and DP06, respectively. The samples were collected in 2013 and analyzed for TPH-G and other gasoline-related constituents (including naphthalene) pursuant to the work plan.

[1] Volatilization of constituents from groundwater is not a concern since concentrations of volatile constituents in groundwater did not exceed groundwater SLs (PIONEER 2011).
[2] Per WAC 173-340-740(3)(b)(iii)(C), default soil-to-groundwater SLs were used as surrogate SLs for the soil-to-indoor air pathway.

- The 2013 soil and soil gas results indicated that there were no longer elevated TPH-G and total naphthalenes concentrations in the vicinity of soil sampling locations MW19 and SVP-1SO, but that elevated TPH-G and total naphthalenes remained in the vicinity of soil sampling locations DP06 and SVP-2SO (PIONEER 2013b). The 2013 follow-up evaluation concluded that the TPH-G and total naphthalenes concentrations in the isolated area proximate to DP06 and SVP-2SO did not pose a concern for the potential soil-to-indoor air pathway based on the magnitude of the soil and soil gas concentrations, the limited size of the area containing elevated concentrations, and the nature of anticipated future land use in this area (PIONEER 2013b).
- Ecology disagreed with the conclusion in the 2013 follow-up evaluation (Ecology 2013b). As a result, the following approach will be used for the soil-to-indoor air pathway going forward (PIONEER 2013c; Ecology 2013c):
    - The soil-to-indoor air pathway will be evaluated by comparing TPH-G and total naphthalenes soil concentrations with MTCA default soil SLs (i.e., TPH-G SL of 100 mg/kg and total naphthalenes SL of 5 mg/kg, which are MTCA Method A soil cleanup levels).
    - The soil cleanup levels and remediation levels developed for TPH-G and total naphthalenes in the RI/FS report will be equal to these SLs.
    - The point of compliance (POC) for TPH-G and total naphthalenes in soil will extend from ground surface to the deepest measured groundwater elevation proximate to the TPH-G and total naphthalenes exceedance. In the vicinity of DP06 and SVP-2SO, the POC elevation is 6.8 feet National Geodetic Vertical Datum of 1929, which corresponds to a depth of approximately four to 4.5 feet below ground surface (bgs).

2 Summary of Soil-to-Indoor Air SL Exceedances

Table 1 and Figure 1 present the TPH-G soil concentrations relative to the 100 mg/kg SL. Table 2 and Figure 2 present the total naphthalenes soil concentrations relative to the 5 mg/kg SL. It should be noted that the TPH-G concentrations at two sampling locations exceeded the 100 mg/kg SL, but are not considered exceedances for the following reasons:

- The TPH-G concentration of 150 mg/kg in the DP24 sample collected from eight to 10 feet bgs is not an exceedance since the sample depth is significantly deeper than the POC in the vicinity of DP24.
- The TPH-G concentration of 220 mg/kg in a 2007 sample collected from MW19 is not an exceedance because this 2007 result has been replaced by the 2013 result from co-located sample location SVP-1SO.[3] The SVP-1SO sample results (TPH-G was not detected at a reporting limit of 5 mg/kg) indicate that TPH-G has likely naturally degraded in this location.[4]

Thus, the only soil sampling locations with TPH-G and/or total naphthalenes SL exceedances were DP06 and SVP-2SO. Based on these results, soil in the area around DP06 and SVP-2SO will need to be remedied pursuant to the pending RI/FS report.

Ecology 2012. Ecology Comments on the Screening Evaluation of the Potential Soil-to-Indoor Air Pathway, East Bay Redevelopment Site, June 13.

[3] The SVP-1SO soil sample was collected at a depth of three to five feet bgs rather than four to six feet bgs since wood was encountered between 5.5 to six feet bgs and the field team believed the three to five foot interval was more likely to be impacted by TPH-G than the four to six foot interval.

[4] This conclusion is also supported by soil gas concentrations in the co-located SVP-1SG sample (PIONEER 2013b).

Figures

Legend

- Site Boundary

Soil Data (0-2' bgs)
- Soil Concentration <= SL
- Soil Concentration > SL

Soil Data (2-6' bgs)
- Soil Concentration <= SL
- Soil Concentration > SL

Soil Data (>= 6' bgs)
- Soil Concentration <= SL
- Soil Concentration > SL

Notes:
- Exceedances are displayed on top of samples that do not exceed the SL.
- Only on-site soil sample locations are displayed.
- Samples that are no longer in place are shown with a dot in the center.
- Sample depth breakouts are based on sample top depth.
- TPH-G concentrations greater than 100 mg/kg in samples collected from MW19 (4-6 feet bgs) and DP24 (8-10 feet bgs) are not considered exceedences (and are not shown on this figure) because the MW19 data was replaced by more recent co-located data from SVP-1SO, and the DP24 sample was collected from a depth deeper than the POC in the vicinity of DP24. Note that the MW19 and DP24 data displayed on this figure are results from different sample depths (i.e., MW19 sample at 8-10 feet bgs and DP24 sample at 10-12 feet bgs).

SVP-2SO	5/7/2013	4-6	**1,100**	

Notes:

J: estimated value

U: not detected at shown concentration

Shaded samples were removed during previous interim actions.

Bolded results exceed the SL.

TPH-G Soil-to-Indoor Air SL: 100 mg/kg

Results are shown as two significant in standard notation with the exception that numbers greater than 100 are rounded to a whole number.

[(1)] TPH-G concentrations greater than 100 mg/kg in samples collected from MW19 and DP24 are not considered exceedances because the MW19 data was replaced by more recent co-located data from SVP-1SO, and the DP24 sample was collected from a depth deeper than the POC in the vicinity of DP24.

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number.

Appendix G

Overview of the Conceptual Site Exposure Model

This page has been left blank intentionally to allow for double-sided printing.

OVERVIEW OF THE CONCEPTUAL SITE EXPOSURE MODEL

A CSEM was developed in order to present a conceptual, site-wide understanding of all potential exposure pathways at the Site based on current and anticipated future land use. The exposure scenarios in the CSEM are reasonable maximum exposure scenarios that are protective of other similar exposure scenarios. The CSEM is presented in Figure 2-13 of the main text. The following text lists the complete exposure pathways, and discusses why certain pathways in the CSEM were considered potentially complete or incomplete. It should be noted that some portions of the Site have already been remediated and redeveloped (i.e., the infrastructure corridor and Parcels 4 and 5), while other portions of the Site are awaiting remediation and redevelopment (e.g., Parcels 2, 3, 6, 7, and 9, the portion of the Site northwest of Parcel 7).

In addition to exposure scenarios based on current and anticipated future land use, the CSEM also includes two baseline no action scenarios to be consistent with MTCA default exposure scenarios. The receptors for the two baseline no action scenarios are single-family residents and commercial workers. These baseline no action scenarios assume the Site is allowed to be developed without any controls or further remedial action, even though this is not a realistic assumption. These baseline no action scenarios were used to develop more protective SLs and RLs. Specifically, the SLs developed in the RI were based on single-family residential land use (i.e., unrestricted land use) even though there is no current residential land use and zoning does not allow future single-family residential land use. Likewise, the protective exposure assumptions for commercial workers were used as surrogates for construction/utility worker exposures and utility maintenance worker exposures during the development of soil RLs.

Complete Exposure Pathways

The complete exposure pathways at the Site are:

- Direct contact (incidental ingestion and dermal contact) with soil by:
  - Construction/utility workers during the remediation and redevelopment construction phase.
  - Utility maintenance workers during the post-remediation and post-redevelopment phase.
- Inhalation of particulates by:
  - Construction/utility workers during the remediation and redevelopment construction phase.
  - Utility maintenance workers during the post-remediation and post-redevelopment phase.

In addition, the following baseline no action pathways were considered complete:

- Direct contact (incidental ingestion and dermal contact) with soil by single-family residents and commercial workers.
- Inhalation of particulates by single-family residents and commercial workers.
- Inhalation of vapors by single-family residents and commercial/industrial workers. This pathway is only complete for TPH-G and total naphthalenes (PIONEER 2014a).

Potentially Complete Exposure Pathways

The following exposure pathways were considered potentially complete for the following reasons:

- Direct contact (incidental ingestion and dermal contact) with soil by trespassers during the pre-remediation and pre-redevelopment phase. Although potentially complete, these pathways were not considered complete given existing fencing, existing exposure barriers, and the general lack of trespassers in the portion of the Site still awaiting redevelopment. Specifically, a perimeter chain-link fence surrounds Parcels 2, 3, 6, 7, and 9, clean gravel covers the portion of the Site northwest of Parcel 7, and clean topsoil and grass covers the landscaped area east of Parcels 4 through 7. For these same reasons, these pathways were considered insignificant compared to the complete exposure pathways in the determination of soil SLs.
- Direct contact (incidental ingestion and dermal contact) with soil and inhalation of particulates by trespassers during the remediation and redevelopment construction phase. Although potentially complete, these pathways were not considered complete given the engineering controls (e.g., Site control measures, dust monitoring) that will be required for remediation and redevelopment construction activities. For these same reasons, these pathways were considered insignificant compared to the complete exposure pathways in the determination of soil SLs.
- Direct contact (incidental ingestion and dermal contact) with on-site surface water (i.e., ponded groundwater in Parcels 2 and 3) by trespassers during the pre-remediation and pre-redevelopment phase. Although potentially complete, these pathways were not considered complete given existing Site fencing around Parcels 2 and 3, the lack of groundwater SL exceedances in the MWs (MW06 and MW22S) located immediately adjacent to on-site surface water (PIONEER 2011a), and the general lack of trespassers in this portion of the Site. For these same reasons, these pathways were considered insignificant compared to other potentially complete exposure pathways in the determination of groundwater SLs.
- Direct contact (incidental ingestion and dermal contract) with on-site surface water (i.e., ponded groundwater in Parcels 2 and 3) and groundwater by construction/utility workers during the remediation and redevelopment construction phase and utility maintenance workers during the post-remediation and post-redevelopment phase were considered potentially complete given the institutional and engineering controls that will be required for construction activities (e.g., required health and safety measures such as personal protective equipment), and the low constituent concentrations in Site groundwater (PIONEER 2009, 2011a).
- Direct contact (incidental ingestion and dermal contact) with surface water and sediment in the East Bay of Budd Inlet by recreators, subsistence fishers, and aquatic organisms during all land use phases. These pathways are only potentially complete for arsenic, TPH-D, and TPH-HO (PIONEER 2011a). Although potentially complete, these pathways were not considered complete for a variety of reasons such as lack of public water access facilities (e.g., designated public beach, swimming facility, shellfish harvesting area) within the portion of Budd Inlet located downgradient of the Site and the general lack of groundwater SL exceedances in the Site groundwater being discharged to downgradient surface water (PIONEER 2009, 2011a). Nonetheless, these pathways were incorporated in the determination of soil and groundwater SLs

for arsenic, TPH-D, and TPH-HO to ensure protection of human health and the environment.

- Consumption of seafood from the East Bay of Budd Inlet by recreators, subsistence fishers, and aquatic organisms during all land use phases. These pathways are potentially complete for arsenic, TPH-D, and TPH-HO only (PIONEER 2011a). Although potentially complete, these pathways were not considered complete for a variety of reasons such as lack of resident fish populations due to the daily presence of tidal mud flats, limited migratory salmon fishing potential, existing restrictions on recreational shellfish harvesting and commercial shellfish growing in Budd Inlet, lack of public water access facilities, and the general lack of groundwater SL exceedances in the Site groundwater being discharged to downgradient surface water (PIONEER 2009, 2011a). Nonetheless, these pathways were incorporated in the determination of soil and groundwater SLs for arsenic, TPH-D, and TPH-HO to ensure protection of human health and the environment.

Incomplete Exposure Pathways

The following exposure pathways were considered incomplete for the following reasons:

- All exposure pathways for on-site recreators during the pre-remediation and pre-redevelopment phase and the remediation and redevelopment construction phase were considered incomplete because these receptors are not present at the Site during these phases.
- Direct contact (incidental ingestion and dermal contract) with soil, inhalation of particulates, and direct contact (incidental ingestion and dermal contract) with on-site surface water/groundwater were considered incomplete for the following receptors because of the cover that will be installed during redevelopment:
  - Urban residents during the post-remediation and post-redevelopment phase.
  - Commercial workers during the post-remediation and post-redevelopment phase.
  - On-site recreators during the post-remediation and post-redevelopment phase.
- Inhalation of particulates by trespassers during the pre-remediation and pre-redevelopment phase was considered incomplete because dust is not being generated during this phase.
- Inhalation of vapors were considered incomplete for the following receptors provided that soils with TPH-G and total naphthalene RL exceedances are removed:
  - Trespassers during the pre-remediation and pre-redevelopment phase and remediation and redevelopment construction phase.
  - Construction/utility workers during the remediation and redevelopment construction phase.
  - Commercial workers during the post-remediation and post-redevelopment phase.
  - Urban residents during the post-remediation and post-redevelopment phase.
  - Utility maintenance workers during the post-remediation and post-redevelopment phase.
  - On-site recreators during the post-remediation and post-redevelopment phase.
- Direct contact (incidental ingestion and dermal contract) with on-site surface water (i.e., ponded groundwater in Parcels 2 and 3) by trespassers during the remediation and redevelopment construction phase was considered incomplete given the engineering controls (e.g., Site control

measures) that will be required for remediation and redevelopment construction activities, the lack of groundwater SL exceedances in the MWs (MW06 and MW22S) located immediately adjacent to on-site surface water (PIONEER 2011a), and the general lack of trespassers in this portion of the Site. Likewise, this pathway was considered incomplete for the hypothetical, baseline no action scenarios (i.e., single-family residents and commercial workers).

- Ingestion and dermal contract with groundwater as a drinking water source were considered incomplete for all receptors since there is no current or anticipated future land use of drinking water on Site or downgradient of the Site. More importantly, a suitable drinking water well could not be installed in shallow groundwater on Site or downgradient of the Site per WAC 173-340-720(2)(b)(i) given the regulatory requirements of Chapter 173-160 WAC and Chapter 246-290 WAC, the extremely shallow depth to water, the low sustainable yield available from shallow groundwater, and proximity to salt water (PIONEER 2009).
- Exposure pathways for terrestrial organisms were considered incomplete because of the cover being installed as part of remediation/redevelopment activities. In other words, the Site is excluded from a terrestrial ecological evaluation per WAC 173-340-7491(1)(b).
- By definition, on-site exposure pathways are incomplete for off-site receptors, and off-site exposure pathways are incomplete for on-site receptors.

STATE OF WASHINGTON
DEPARTMENT OF ECOLOGY
PO Box 47775 • Olympia, Washington 98504-7775 • (360) 407-6300

September 21, 2009

Ms. Joanne Snarski,
Environmental Program & Project Manager
Port of Olympia
915 Washington Street NE
Olympia, WA 98501

Re: Approval of Remedial Investigation Work Plan, East Bay Redevelopment, Port of Olympia, Olympia, Washington, Ecology Facility/Site No. 5785176, Agreed Order DE5471.

Dear Ms. Snarski:

As we discussed in our meeting on September 17, 2009, the Department of Ecology (Ecology) and the Port of Olympia (Port) both agree that the recent debate regarding additions to the scope of the Remedial Investigation (RI) Work Plan should be halted. This will enable the Port to focus on completing the draft RI Report for Ecology review as soon as possible. **Therefore, Ecology considers the RI Work Plan to be approved.**

Ecology has previously expressed their concerns and identified areas that require clarification through past communications with the Port. We look forward to seeing these issues addressed in the draft RI Report. If Ecology determines that further RI work, including work on issues previously discussed, is needed after reviewing the draft RI Report, then that work will be identified in the Supplemental RI process to be performed as indicated in the Agreed Order.

If you have any questions, please contact me at (360) 407-6247 or via e-mail at stee461@ecy.wa.gov.

Sincerely,

SSTeel

Toxics Cleanup Program, SW TCP
PO Box 47775
Olympia, Washington 98504-7775

Dear Mr. Teel:
Attached please find a copy of the Final Remedial Investigation Work Plan (RI Work Plan). The RI Work Plan is submitted to you in compliance with Section VII(C) of the subject Agreed Order (Order) between the Port of Olympia (Port) and Ecology.

The Final RI Work Plan addresses your September 22, 2008 comments on the September 3, 2008 Ecology Review Draft RI Workplan. We have submitted a comment response letter under separate cover that documents our response to each comment. The most significant changes to the RI Workplan in response to your comments include:

- Incorporated the additional analytical testing requested in your September 22, 2008 comment letter.
- Clarified wording on exposure routes and pathways.
- Added information on artesian wells and technical approach to locate them.
- Clarified schedule for groundwater monitoring and decision criteria for installing new shallow groundwater monitoring wells.
- Revised the SAP to discuss evaluation of potential groundwater seeps and added tables summarizing the analytical target reporting limits.

We appreciate your responsiveness and cooperation during this process.

Respectfully,

Joanne Snarski, Environmental Program & Project Manager
Port of Olympia

REMEDIAL INVESTIGATION WORK PLAN
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA
OLYMPIA, WASHINGTON
FOR
PORT OF OLYMPIA

1.0 INTRODUCTION

This document is a work plan for conducting a Remedial Investigation (RI) at the Port of Olympia's (Port's) 13-acre East Bay Redevelopment Site (Site) located at 315 Jefferson Street NE in Olympia, Washington. The Site is an area in transition from historical lumber milling activity that began in the late 1800s to that of future commercial uses. The Site lies on the south end of the Port Peninsula adjacent to the East Bay of Budd Inlet. The location of the Site relative to surrounding physical features is shown in Figure 1.

This work plan was prepared in compliance with Agreed Order (AO) No. DE5471 and satisfies the requirements for an RI work plan in Chapter 173-340 Washington Administrative Code (WAC). The work plan outlines planned sampling and analysis activities associated with the RI and summarizes results of previous sampling and testing activities. Previous environmental site characterization activities have been completed at the Site and presented to Washington State Department of Ecology (Ecology). Additional information is needed to more fully understand the nature and extent of contamination and the potential risks to human health and the environment, and to evaluate cleanup actions.

The planned elements outlined in this RI work plan will supply the information necessary to move this project forward so that the first phase of redevelopment can be completed. That phase includes an interim action and infrastructure construction (roads and utilities) planned for spring of 2009. This RI work plan relies on (a) past site characterization results (previously presented to Ecology) and (b) newly developed information such as fill histories , geologic cross sections, and groundwater characteristic information to develop the sampling and analysis approach for this RI.

1.1 SITE DESCRIPTION

The East Bay Redevelopment area includes part of Parcel 1 and all of Parcels 2, 3, 4, 5, 6, 7 and 9 and associated near-by infrastructure areas. The Site is shown in Figure 2. As defined in Model Toxics Control Act (MTCA) and stated in the AO, the Site is defined by the extent of contamination caused by the release of hazardous substances at the subject property.

The West and East Bays of Budd Inlet have been dredged, and dredge spoils have been placed as fill on the peninsula since the late 1800s (Figure 3). Most of the Site is situated on fill material. Fill sources or types include dredge spoils, debris derived from historical lumber milling operations (such as wood debris and shredded wood), construction debris (such as concrete, bricks and dimensional lumber), and roadway fill for Marine View Drive and Olympia Avenue.

The Site is relatively flat, with ground surface elevations ranging from approximately 10 to 12 feet (National Geodetic Vertical Datum [NGVD] 29). The northern and western portions of the Site are paved with asphalt, and the southern and eastern portions are covered with crushed rock and bare land vegetated with low grasses. Most of the Site is currently fenced. A rail spur runs along Jefferson Street NE, and a

crude road runs along the eastern side of a large former mill warehouse building, which was recently demolished.

1.2 PURPOSE AND OBJECTIVES

The Site is currently under an AO with Ecology. This RI work plan provides a summary of site characterization results completed to date and outlines proposed additional study for the purposes of:

- Characterizing the nature and extent of contamination at the Site;
- Assessing the potential risk to human and ecological receptors; and
- Providing the information that will allow evaluation and selection of cleanup action alternatives.

The project objectives are:

1. Completion of an RI report in general accordance with Chapter 173-340 WAC and AO No. DE-08-TCPSR-5471 and in accordance with Section VII (C) of the AO;
2. Preparation of an interim action work plan and completion of an interim action in accordance with Section VII (A) of the AO that will facilitate infrastructure development (roads and utilities) around the Site; and
3. Preparation of a Feasibility Study (FS) and Cleanup Action Plan (CAP) to facilitate redevelopment of the subject property. Although the information obtained in this (and any subsequent) RI will be used to complete a FS and CAP, a FS and CAP are not part of this AO. A separate AO or consent decree will be negotiated between Ecology and the Port.

1.3 WORK PLAN ORGANIZATION

As described previously, a significant amount of study has been completed at the Site. However, this RI work plan is being used as a document not only to plan for additional study, but also provides new information, such as fill history maps, geologic cross sections, and groundwater monitoring information that supplements the last subsurface characterization (December 20, 2007). For example supplemental groundwater monitoring information and dioxin/furan groundwater testing from MW-16 are summarized below (Section 4.3.2) and included in Appendices A and C.

This work plan includes sections that summarize historical site use, current and future land use, site subsurface conditions, contaminant transport and exposure models and a preliminary conceptual site model (CSM) (Sections 2 through 6, respectively). The information contained in these sections and their associated figures were used to establish the supplemental RI data objectives and tasks described in Section 7. Section 7 and Tables 1 through 3 describe proposed new soil and groundwater explorations and testing. After the supplemental soil and groundwater data are acquired, a risk assessment will be performed to develop cleanup levels and remediation levels as appropriate as outlined in Section 8. References are included in Section 9. This RI work plan also includes a sampling and analysis plan (SAP), quality assurance project plan (QAPP), and health and safety plan (HASP) in Appendices D and E.

1.4 REGULATORY FRAMEWORK

Ecology identified the Port as a "potentially liable person" (PLP) for the Site under RCW 70.105D.020 (21) and RCW 70.105D.040. AO No. DE5471 between Ecology and the Port was issued October 3, 2008 and requires completion of an RI and Interim Action for the Site. The AO was developed cooperatively between the Port and Ecology. The AO outlines the work to be performed and ensures that the Site will

be investigated and cleanup alternatives evaluated in a timely fashion in accordance with applicable laws and regulations. The Port performed investigative studies under the MTCA on a voluntary basis with oversight by Ecology prior to and during development of the AO.

2.0 SITE HISTORY

Detailed information describing the Site, including its known history, current uses, existing property features, soil and groundwater conditions and a summary of environmental investigations completed at the Site between 1888 and the present, is presented in a Phase I ESA of the Site (GeoEngineers, March 2007), a Supplemental Site Use History and Soil and Groundwater Sampling Clarifications Report (GeoEngineers, August 2007) and a Draft RI/FS and Conceptual CAP, dated December 20, 2007 (GeoEngineers, December 2007). As outlined in these documents and summarized in the AO, the site history is as follows:

- Historical documents provided to Ecology show that the earliest documented activities on portions of the Site were related to several types of lumber milling operations (such as sawmill, planing mill, shingle mill and veneer/plywood manufacture). Lumber milling operations were conducted under various owners/operators from at least 1888 until about 1968. Historical owners/operators included the St. Paul & Tacoma Lumber Company (mid-1940s through early 1970s, Parcels 2 through 7); Olympia Veneer Company (1924 to mid-1940s, Parcels 1 through 5); Olympia Planing Mill (owned/operated by Springer and White, 1888-1891, Parcel 3); Olympia Sawmill (owned/operated by Allen & Harknes, 1888, Parcel 3); G.S. Allen's Saw Mill (1891, Parcel 3); Olympia Door and Lumber Company's planing mill and the East Side Lumber Company's saw mill (1896, Parcel 3); H.G. Richardson's Shingle Mill (1908, Parcel 3); the Olympia Door Company Sash and Door Factory (1908-1924, Parcel 9); Puget Sound Pipe Company (wooden pipes, 1888-1896, Parcel 1); and the National Wood Pipe Company (1908, Parcels 3 through 6).
- Based on historical maps, the lumber milling operations included various support facilities that included: machine/electrical/repair shops, dry kilns, veneer driers, power plants, hog fuel boilers, transformers, engine rooms, bulk fuel storage areas, blacksmith shops and tar dipping tanks. Also, historical aerial photographs show that logs were rafted in the bay, presumably for transport along Budd Inlet to various sawmills.
- Historical documents also revealed that dredged spoils from Budd Inlet have been placed on the peninsula since 1892. For example, a Sanborn Map dated 1888 indicated that several buildings were present. These buildings were likely constructed on piers that extended over the water and/or mudflats that existed prior to significant filling operations that occurred from 1896 to 1911. The newly reclaimed land is currently known as the Port Peninsula.
- Since lumber milling operations ceased in 1968, the Port and its tenants have used portions of the Site for commercial and light industrial activities and/or storage.

As noted in the AO and previously prepared reports submitted to Ecology, past operations on property that is part of the Site have resulted in the contamination of soil and/or groundwater at levels that exceed the MTCA cleanup standards for all of the following constituents: total petroleum hydrocarbons (TPH), carcinogenic polycyclic aromatic hydrocarbons (cPAHs), chlorinated dibenzo-p-dioxins and chlorinated dibenzofurans (dioxins/furans [D/F]), polychlorinated biphenyls (PCBs) and metals. Additional details regarding the magnitude and extent of these contaminants are provided in later sections of this RI work plan.

Figure 4 shows where these past historical operation areas were located on the Site, and Figure 5 groups the historical operation areas into areas of concern relative to historic shorelines (past fill history). Figure 5 also outlines chemicals of potential concern (COPC) that may be associated with the historic operational areas.

3.0 CURRENT AND FUTURE LAND USE

Current and future land use for the Site can be divided into three general time categories: 1) Current Land Use, 2) Construction Phase, and 3) Future Land Use – Post Construction. Currently the Site is mostly vacant and unused, although boats are currently being stored on a portion of the Site. The construction phase will be temporary and will include excavation and activities typically associated with major development construction projects. Future development plans by the Port and City of Olympia call for construction of buildings, pavement and may include other engineered barriers on top of existing Site soil. The Port recently initiated short platting of the Site into eight parcels (1 through 7 and 9) for sale or lease for redevelopment. Proposed development uses for these parcels are presented in the table below.

East Bay Redevelopment Parcel Details

Parcel Number	Parcel Area (acres)	Proposed Development Use
1	1.6	Mixed Use/Commercial
2	1.2	Mixed Use/Commercial
3	2.7	Mixed Use/Commercial
4	0.83	Public Plaza (Sale to LOTT Alliance pending)
5	1.8	Hands on Children's Museum (HOCM) (Sale to HOCM pending)
6	0.9	Mixed Use/Commercial
7	0.9	Mixed Use/Commercial
9	0.5	Mixed Use/Commercial
Infrastructure	2.5	Roadway and Utility Improvements
Total Area	12.9	—

The area of each parcel is based on drawings provided by Skillings Connolly, dated February 2008, and is subject to change.

Additionally, as outlined in the AO, the Site is immediately west of the LOTT Alliance Wastewater Treatment Plant Expansion ("LOTT Expansion") Site. The LOTT Expansion Site includes the area of the existing LOTT Alliance Budd Inlet Wastewater Treatment Plant (500 Adams Street NE), the parking lot south of the plant, and Parcel 8, as shown in Figure 2. The LOTT Expansion Site is currently enrolled in Ecology's Voluntary Cleanup Program (VCP) because of residual soil and groundwater contamination from former lumber mills (VCP identification number SW0933). Former lumber mill operators on the LOTT Expansion Site include the Olympia Door Company and the Springer Mill Company. Available historical information does not conclusively indicate whether the operational area of the St. Paul & Tacoma Lumber Company (one of the former operators of the Site) included the LOTT Expansion Site. Also, it is not currently believed that contamination from the LOTT Expansion Site and the Site are commingled. Therefore, the LOTT Expansion Site (Parcel 8) is not included in the scope of the AO and

is not part of the Site. However, if Ecology determines in writing that adequate evidence exists to support combining the two sites, the LOTT Expansion Site will become part of the Site.

4.0 SITE SUBSURFACE CONDITIONS

4.1 SITE GEOLOGY

Understanding of the geology and fill history beneath the Site is well understood based on compiled data from multiple sources, including historic aerial photographs, Sanborn Fire Insurance Maps, U.S. Army Corps of Engineers dredging maps, and the 65 explorations advanced at the Site by GeoEngineers and others. The approximate locations of the explorations completed at the Site to date (including those completed by others) are shown on Figures 3, 5 and 6. The Site is underlain by fill that varies in thickness from approximately 5 to 15 feet. Native sand, silts, and clays underlie the fill. Locations of geologic cross sections are shown in Figure 6 (cross section locations overview) and Figures 7a to 7f to illustrate the geology beneath the Site.

4.1.1 Fill Materials (Lithologies and Fill Type and Timeframe)

There are four principal fill lithologies beneath the Site that are generally (but not in all cases) listed below from youngest to oldest; or from highest to lowest in the geologic section:

- Silty gravel associated principally with the post-1975 fill. This gravel is exposed along the shoreline bluff where the Site adjoins Budd Inlet.
- Light colored coarse- to fine-grained sand with a trace of silt and occasional gravel, construction debris and localized pockets of wood debris. The wood debris is composed of burnt wood, wood chips, shredded wood and decomposed wood related to former sawmill and log rafting activities.
- Dark colored coarse- to fine-grained sand with wood debris. The wood debris is more prevalent in this fill unit than the light sand fill unit.
- Beneath some portions of the Site, disturbed silt with wood debris separates the fill from the underlying undisturbed native sediments. This is thought to be silt deposited at the base of East Bay in tidal flats and/or by Moxlie Creek, and subsequently mixed with wood debris by natural erosion/deposition and filling activities by humans. This silt could be categorized as both fill and/or native.

Gravel from the post-1975 fill forms the shoreline adjacent to Budd Inlet.

The lithology of fill beneath the Site varies laterally and vertically depending on the age of the fill (the time interval when fill was placed). The fill was placed in five main episodes, with the last fill placed after 1975. Figures 3and 6 show the lateral extent of fill from the five main fill episodes, based on aerial photographs. The principal lithologies associated with the fill episodes are summarized from oldest to youngest below.

- Pre-1891: This fill is present beneath the southwest portion of the Site and appears to consist mostly of the dark sand lithology with some pockets of wood debris and pockets of silt.

- 1891 to 1908: This fill is present beneath much of the central portion of the Site (Figures 3 and 6). Based on historical records, this fill is material dredged from Budd Inlet to deepen the marine channel and consists of a dark brown to black coarse to fine sand.
- 1908 to 1948: This fill is present beneath the northwest portion of the Site and appears to consist mostly of the light sand with pockets of wood debris and pockets of gravel.
- 1948 to 1975: This fill is present beneath the eastern portion of the Site and appears to consist mostly of the light colored sand with pockets of wood debris.
- Post-1975: This fill is present along the eastern portion of the Site along the bay front and appears to consist of a silty sandy gravel.

4.1.2 Native Sediments

Underlying the disturbed silt and is fine- to medium-grained sand that varies in thickness from about 5 to 25 feet and greater. Below the sand is a thick deposit of silt and clay that forms the regional aquitard. The aquitard is not being studied as part of this RI but was described by Pacific Groundwater Group (2007) as part of their study for a nearby property. In that report, the aquitard is described as 45 to 95 feet of fine-grained sediments which, because of its relatively low permeability, is classified as an aquitard. In addition, three deep (75 to 100 feet bgs) cone penetrometer borings were drilled on the Site for geotechnical purposes and confirmed the presence of the aquitard which was at least 30 to 35 feet thick beneath Parcel 3. Two of these borings that were drilled to 89 and 65 feet below ground surface are shown in the geologic cross sections C-C' and E-E' (Figures 7c and 7e).

4.2 SITE HYDROGEOLOGY

4.2.1 Groundwater Occurrence

Groundwater beneath the Site occurs in a shallow unconfined aquifer. Depth to groundwater varies from 1 to 9 feet below ground surface (bgs) based on measurements from a groundwater monitoring well network consisting of 20 wells. The shallow aquifer is separated from deeper artesian aquifers by a thick (45- to 95-foot) layer of lower permeable silts and clays that compose the regional aquitard. Because the natural water flow direction in the artesian aquifers is generally upward (Robinson & Noble, Inc., 1999 and Pacific Groundwater Group, 2005) and the aquitard physically separates the aquifers (Pacific Groundwater Group 2007), groundwater in the shallow aquifer does not impact water quality in the deeper aquifers. Therefore, the deeper aquifers are not part of the RI.

4.2.2 Shallow Groundwater Flow

Groundwater flow was evaluated based on groundwater monitoring events completed by GeoEngineers in August 2007 and by Greylock Consulting LLC (Greylock) on July 16, 2008. Greylock's monitoring was associated with a tidal influence study. Greylock's technical memorandum describing this study with tables showing groundwater measurements and groundwater elevation contour figures are included in Appendix A. Groundwater elevations based on these monitoring events are summarized in Table 1 of Appendix A. Interpolated groundwater elevation contours for the GeoEngineers August 2007 monitoring event and the Greylock July 16, 2008 event are shown in Figures included in Appendix A.

Groundwater flow patterns at low tide and high tide are similar, with the exception of a steeper gradient near the shoreline during low tide. Most of the groundwater flow across the Site is towards Budd Inlet. However, a groundwater mound is present at both low and high tide at the southwest portion of the Site near two monitoring wells (MW14 and MW06). Because of this mound, some groundwater in this

portion of the Site flows away from Budd Inlet. A groundwater high was also present around offsite monitoring well MW17, on Parcel 8, near the northwestern portion of the Site, during both high and low tides. Greylock postulated that these groundwater highs are likely caused by leakage from artesian wells that are alleged to be present in these vicinities based on conversations with old-timers in the area and artesian well maps provided by the City of Olympia. Artesian wells on Site are discussed further in Appendix B and potential locations of artesian wells are shown on Figure 4. The horizontal groundwater gradient varied from about 0.003 feet per foot in the portion of the Site not affected by tides to approximately 0.08 feet per foot in the area affected by tides near the shoreline.

All of the groundwater monitoring events occurred during drier months, and additional monitoring is proposed to collect data representative of wetter months in order to evaluate seasonal fluctuations in groundwater elevations.

Four potential groundwater seeps along the shoreline were identified by Greylock during a low tide on July 16, 2008. The locations of the seeps were surveyed and are shown on the groundwater flow maps in Appendix A. The seeps are thought to represent areas where shallow groundwater discharges to the East Bay of Budd Inlet, immediately west of the Site. Verification of the potential groundwater seeps as groundwater, rather than surface water leakage or discharge from buried pipes, will be conducted as part of the RI. Methods for evaluating the seeps are presented in the SAP (Appendix D).

4.2.3 Tidal Influence Studies

Two tidal influence studies have been completed at the Site:

- A tidal influence study using downhole transducers and data loggers at Parcel 3 was completed by GeoEngineers in February 2007. This study was completed over an approximately 72-hour period and involved monitoring wells MW05, MW06, MW07 and MW09. The results of that study indicated that shallow groundwater beneath the southwestern portion of the Site does not appear tidally influenced (GeoEngineers, April 2007).
- Greylock completed a tidal study by measuring water levels in groundwater monitoring wells at low tide and at high tide on July 16, 2008. Comparing the low tide and high tide groundwater elevations provides a basis to evaluate what portions of the Site are affected by tidal fluctuations. The low tide was -1.4 Mean Lower Low Water (MLLW) and the high tide was +14.4 MLLW. During this 15.5-foot tidal fluctuation, only two (MW12 and MW18) of the twenty wells showed greater than one foot of change in groundwater elevation between low tide and high tide. MW12 and MW18 are screened in the silty gravel post-1975 fill that borders the entire Site adjacent to Budd Inlet. Both wells are located within 110 feet of the shoreline. Greylock concluded that tidal influence on groundwater elevations is limited to the area of coarse fill within 110 feet of the shoreline.

4.2.4 Groundwater Use

There are no shallow aquifer groundwater supply wells located on the Site. At this time, shallow groundwater at the Site is not thought to be potable. The potential use of shallow groundwater at the Site as potable water will be discussed further in the RI/FS reports.

4.3 SUMMARY OF PREVIOUSLY COLLECTED CHEMISTRY DATA

4.3.1 Soil

Soil chemistry data have been collected from 122 soil samples obtained from 45 explorations (DP-01 through DP-25 and MW-01 through MW-20) and four soil samples obtained from four test pits (TP-01 to TP-04). The findings of the studies completed to date indicate that chemicals of potential concern (COPCs) appear to be associated with previous activities at the Site (for example, lumber milling operations such as fueling, machining, maintenance and other related industrial activities). According to previous environmental studies, soil contamination is present on Parcels 1, 2, 3, 4, 5 and 7 and portions of the infrastructure parcel.

Gasoline-, diesel- and motor oil-range petroleum hydrocarbons, naphthalene, bis(2-ethylhexyl)phthalate (BEP), arsenic, cadmium, cPAHs (Toxicity Equivalent Concentration[1] [TEQ]) and D/F (TEQ) were detected in soil at one or more locations at concentrations greater than MTCA Method A and/or Method B screening levels. The petroleum hydrocarbons, cPAHs and metals concentrations exceeding these MTCA screening levels in soil are presented in Figures 8 through 11. The magnitude and extent of the soil with concentrations greater than the MTCA screening levels appears localized to areas adjacent to historical sources of COPCs (Figure 5).

Soil chemical analytical data are also graphically presented on the geologic cross sections on Figures 12a through 12f. The figures illustrate the thoroughness of sample testing in each lithologic unit and across the Site. These figures were used to evaluate the sample density in different fill types and episodes and identify where additional samples are needed.

4.3.2 Groundwater

Groundwater chemical data have been collected from 19 monitoring wells. Impacted groundwater has been observed beneath Parcels 2 and 5. However, additional groundwater monitoring is necessary to further evaluate groundwater conditions at the Site. Arsenic, petroleum hydrocarbons and bis(2-ethylhexyl) phthalate[2] are the only three COPCs that have been detected at elevated concentrations in groundwater samples obtained from shallow groundwater monitoring wells. Groundwater chemical analytical results from 2006 and 2007 are included in Figure 13. The following additional groundwater testing was conducted in July 2008 to evaluate the presence of D/F at MW16:

- **Sampling of MW16:** A groundwater sample was obtained from monitoring well MW16 on July 29, 2008, and tested for D/F, semivolatile chemicals and selected metals. This sample was obtained to support a National Pollutant Discharge Elimination System (NPDES) permit application related to the future discharge of water during an infrastructure improvement project. Monitoring well MW16 is located close to test pit TP02 where the highest measured D/F concentration in soil was identified. Additionally, MW16 is a downgradient well located at an historic potential D/F source location (former boiler house). The analytical reports are included in Appendix C.

[1] Regulatory evaluation of cPAHs and D/F are completed using Ecology's toxicity equivalency methodology. This methodology is completed by multiplying the detected concentrations of specific analytes (for cPAHs) and congeners (for D/Fs) by their respective toxicity equivalency factors (TEFs). The results of the calculations are then added to produce a toxicity equivalency concentration.

[2] Bis(2-ethylhexyl) phthalate was detected in MW06, MW08 and MW10 on January 18, 2007, and was likely the result of lab or sampling error.

- **Results:**
  - The sample was analyzed for D/F by U.S Environmental Protection Agency (EPA) Method 1613B. This testing was performed by Columbia Analytical Services. Of the 17 congeners tested, only two (OCDD and OCDF) were detected. MTCA requires evaluation of dioxin and furan results based on toxicity equivalent (TEQ) methodology. Using the TEQ approach, the TEQ for this sample is 0.00381 picograms per liter (pg/L).
  - The groundwater sample was also analyzed for semivolatile compounds and metals by EPA Methods 8270C, 6020, and 7470A. This testing was performed by TestAmerica Laboratories. All of the results were less than MTCA Method A and/or Method B screening levels.

4.4 NATURE AND EXTENT OF CONTAMINATION BASED ON PREVIOUS RI DATA

This section summarizes the nature and extent of contamination based on data that has been collected to-date. These data show that contamination is proximate to specific historical sources of contamination and is not widespread.

4.4.1 On-Site Soils

The highest concentration and most impacted soil on the Site is located on Parcel 3, which has had the longest use. In addition, isolated areas of impacted soil were identified throughout the Site (Parcels 2, 4, 5, and 7) as identified in specific borings and test pits. Locations and depths of samples where COPCs were detected in soil at concentrations above the screening levels are shown in Figures 8 through 11, and on cross-sections in Figures 12a through 12f.

The borings and test pits that are impacted with various COPCs in soil are as follows:

- **Petroleum-impacted soil:** MW02, MW06, DP02, DP04, DP06, DP08, DP13, DP15 and DP24 (Parcel 3); DP17 and DP18 (Parcel 4); DP21 and MW19 (Parcel 7); MW15 and DP19 (Parcel 9).
- **Metals-impacted soil:** arsenic and cadmium at DP04 and cadmium at MW05 (Parcel 3); lead at DP11 (Parcel 5); arsenic at DP17 (Parcel 4); arsenic at DP21 (Parcel 7), and; lead at Delta Consultants boring B-2 (Parcel 1).
- **Semivolative organic compound (SVOC)-impacted soil (naphthalene only):** DP06 (Parcel 3).
- **cPAH-impacted soil:** DP02, DP06, DP08, DP14, DP15, DP16, MW05 and MW10 (Parcel 3); DP16 (Parcel 4); DP11 and MW04 (Parcel 5).
- **D/F-impacted soil:** TP01 and TP02 (Parcel 4); TP03 and TP04 (Parcel 3).

The nature and extent of soil contamination at the Site has largely been defined. In some areas, additional information is needed for vertical and horizontal delineation of COPCs. In addition, data is needed to plan the management of soil that will be excavated as part of the infrastructure improvements planned for early 2009. These data gaps are the purpose for this supplemental RI. Objectives for supplemental sampling are discussed in Section 7.0 below.

4.4.2 Groundwater

Over an 18-month period, one complete round of groundwater monitoring from the well network has been completed. Groundwater analytical results are presented on Figure 13. COPC concentrations exceeding

MTCA Method A cleanup levels were detected in groundwater from only two of the 19 on-site monitoring wells located on the Site in this sampling:

- MW04 (arsenic), Parcel 5
- MW13 (diesel and arsenic) Parcel 2

Arsenic exceeding screening levels was also identified in off-site well MW17, located on the adjacent LOTT property (Parcel 8).

The nature and extent of groundwater contamination appears to be limited to isolated locations of arsenic and diesel range hydrocarbons identified in one well (concentration identified in this well was equal to the MTCA Method A cleanup level for diesel-range hydrocarbons but did not exceed it). However, additional groundwater monitoring is proposed in this supplemental RI to confirm the nature and extent of COPCs in groundwater.

5.0 CONCEPTUAL SITE CONTAMINANT TRANSPORT MODEL

A conceptual site contaminant transport model (CSCTM) was developed to show the historical release(s) of hazardous substances at the Site and the subsequent potential migration of those hazardous substances in environmental media. The model was developed to help direct the RI exploration program. A separate conceptual model related to potential exposure pathways is presented in Section 6.0.

The CSCTM is shown graphically in Figure 14 and possible contaminant sources and transport mechanisms are summarized below:

- Former sawmills and other industries directly discharged contaminants to the ground surface as a result of leaks, spills and operational discharges. These discharges were to the ground surface at the time an industry was operating ("historical working surface"), and that ground surface has now been covered by more recent fill.
- Airborne contaminated particles emitted from on-site sources (such as the hog fuel burner or the power house on Parcels 3-4), off-site sources (such as hog burners, forest fires, and/or the refuse fire area on Parcel 8) were deposited on the historical ground surfaces across the entire Site.
- As the Site was filled with dredged material, potential sources of contamination such as burnt wood were incorporated into the fill. Some of this material now exists in the subsurface below the Site.
- Some dredged material that was used as fill in the Site may contain contaminants.
- Stormwater and general surface runoff while industries were operating transported contaminants to areas being filled at that time.
- Some contaminants in soil leach into groundwater and are transported as dissolved chemicals in groundwater.
- Petroleum hydrocarbons might have been discharged in sufficient quantities to accumulate as free product on top of the groundwater table (shown as a hypothetical oil spill on Figure 14).
- Groundwater flows towards Budd Inlet, where it discharges through seeps in the shoreline bluff.
- Water from deeper aquifers may move upward through the aquitard into the shallow aquifer or Budd Inlet. The upward movement of water prevents contaminated water in the shallow aquifer from moving downward.

- Some of the recharge to the shallow aquifer comes from surplus water from artesian wells that is discharged directly onto the ground surface and leakage through artesian well casings.

6.0 CONCEPTUAL SITE EXPOSURE MODEL

As part of the development of this work plan, PIONEER Technologies Corporation developed a Conceptual Site Exposure Model (CSEM) for the Site (Figure 15). The CSEM evaluated potentially exposed populations (receptors) and exposure pathways[3] as summarized below. The CSEM is based on current Site data (GeoEngineers 2007), Site land use presented in Section 3.0 and the CSCTM presented in Section 5.0. The CSEM will be refined as necessary once more data are collected pursuant to this RIWP. It should be noted that reasonable maximum exposure scenarios were used to represent and be protective of all possible exposure scenarios as mentioned in this section and the Figure 15 footnotes.

6.1 HUMAN HEALTH EXPOSURE PATHWAYS

Potential receptors and exposure pathways were identified and evaluated in the CSEM for the following three distinct land uses at the Site:

- Current Land Use (that is, prior to redevelopment of the Site)
- Construction Phase (that is, during redevelopment of the Site)
- Future Land Use (that is, following redevelopment of the Site)

In accordance with WAC 173-340-740, the following potential soil-based exposure pathways were evaluated for human health at the Site:

- Direct Contact with Soil
- Soil to Outdoor Air (dust)
- Soil to Indoor Air (vapor intrusion)
- Soil to Surface Water (runoff)
- Soil to Groundwater

In accordance with WAC 173-340-720, the following potential groundwater-based exposure pathways were evaluated for human health at the Site:

- Groundwater as Drinking Water
- Groundwater to Indoor Air (vapor intrusion)
- Groundwater to Surface Water/Sediment

6.1.1 Current Land Use

This former industrial property is currently being prepared for redevelopment. As such, the Site is mostly vacant and unused, although boats are currently stored on a portion of the Site. Most of the Site is

[3] A complete exposure pathway is comprised of: (1) a source of COPCs and a release to the environment (e.g., a spill), (2) an environmental transport medium for the release COPCs (e.g., soil), (3) an exposure point (i.e., the point of potential human contact with the affected medium), and (4) an exposure route (e.g., ingestion). In order for a COPC to pose a risk to human health a complete exposure pathway must be present.

currently fenced. A small amount of ponded water (suspected to be from below grade artesian wells) is currently present on-site, but should be eliminated in the near-term with the planned decommissioning of artesian wells. One CSTCM component that should be reiterated here is the historical working surface, which is the historical grade where industrial buildings were located and operations were conducted on the Site prior to later filling and grading. In general, the historical working surface (which is where site releases would have occurred) is approximately 1 to 4 feet below existing grade.

The Site is bounded by existing commercial and/or industrial land use to the north, west and south. A recreational walking path is located immediately east of the Site. The East Bay of Budd Inlet is also located east of the Site.

Potential human receptors that were considered for current land use were residents, commercial/industrial workers, trespassers and recreators (for example, recreational users of the adjacent walking path and the East Bay of Budd Inlet). Based on the CSEM, complete or potentially complete exposure pathways (pending further evaluation) for these potential receptors during current land use are:

- **Trespassers**:
  - Incidental ingestion of soil
  - Dermal contact with soil
  - Inhalation of vapors
  - Dermal contact with suspected ponded groundwater
- **Recreators**:
  - Incidental ingestion of off-site surface water
  - Dermal contact with off-site surface water
  - Consumption of seafood from East Bay

Based on existing information, other potential exposure pathways are not complete in the CSEM during current land use for the following reasons:

- All of the exposure pathways are incomplete for residents and commercial/industrial workers under current land use since there are no residents or regular commercial/industrial workers on-site currently. Nor will there be any residential or commercial/industrial land uses prior to redevelopment. It should be noted that the current trespasser exposure scenario is more conservative and therefore protective for other current receptor scenarios, such as a scenario for people who access boats that are currently stored on a portion of the site.
- Inhalation of particulates by on-site trespassers, off-site recreators, and other potential off-site receptors are incomplete pathways because the historical working surface (which is where site releases would have occurred) is approximately 1 to 4 feet below existing grade.
- All of the on-site pathways (for instance, incidental ingestion of soil, dermal contact with soil, inhalation of vapors, dermal contact with suspected ponded groundwater) are incomplete for recreators because there is no on-site recreational land use prior to redevelopment.
- Soil to surface water is an incomplete pathway for all potential receptors since storm water generally infiltrates rather than runs off (see soil to groundwater pathway for leaching scenarios) and the historical working surface (which is where site releases would have occurred) is approximately 1 to 4 feet below existing grade.

- The soil to groundwater and groundwater as drinking water pathways are incomplete for all potential current receptors since there are no current drinking water wells in shallow groundwater on-site or downgradient of the site, and the confined aquifer in which existing on-site artesian wells are completed is not impacted by a release from the site. Furthermore, existing artesian wells are not usable since they are completed below ground surface and will be decommissioned.
- Incidental ingestion of suspected ponded groundwater is an incomplete pathway for all potential receptors since this pathway is based on activities in which water is routinely near the mouth (for instance, swimming).
- The surface water as drinking water pathway is incomplete for all receptors since the marine water in the East Bay of Budd Inlet is not suitable for use as a domestic water supply in accordance with WAC 173-340-730(2)(b)(ii).
- The groundwater to surface water/sediment pathway is not applicable for residents, commercial/industrial workers or trespassers because the exposure routes (incidental ingestion of surface water, dermal contact with surface water and consumption of seafood) are based on recreational pursuits. In addition, the current recreator exposure scenario is more conservative and therefore protective for other current human receptor scenarios with respect to the groundwater to surface water/sediment pathway.

6.1.2 Construction Phase

During the temporary construction phase of Site redevelopment, land use will be typical of a major construction project and will include utility infrastructure excavations and other significant earthwork. Standard construction practices such as fencing and site control will be in place to limit site access for recreators and other members of the public during the construction phase. In addition, site-specific construction plans will incorporate best management practices and worker safety programs appropriate for the presence of COPCs in soil.

Potential human receptors that were considered for construction phase land use were utility installation workers, utility installation trespassers, building construction workers, building construction trespassers, and off-site recreators. Based on the CSEM, complete or potentially complete exposure pathways (pending further evaluation) for these potential receptors during the construction phase are:

- **Utility Installation Workers and Utility Installation Trespassers**:
  - Incidental ingestion of soil
  - Dermal contact with soil
  - Inhalation of particulates
  - Inhalation of vapors
  - Dermal contact with on-site groundwater in a utility excavation
- **Building Construction Workers and Building Construction Trespassers**:
  - Incidental ingestion of soil
  - Dermal contact with soil
  - Inhalation of particulates
  - Inhalation of vapors

- **Recreators**:
  - Incidental ingestion of off-site surface water
  - Dermal contact with off-site surface water
  - Consumption of seafood from East Bay

The soil to surface water, soil to groundwater, groundwater as drinking water, and groundwater to surface water/sediment pathways are not complete in the CSEM for all construction phase workers and trespassers for the same reasons given above in the current land use discussion. Incidental ingestion of on-site groundwater in a utility excavation is an incomplete pathway for all construction phase workers and trespassers since this pathway is based on activities in which water is routinely near the mouth (for instance, swimming). Dermal contact with on-site groundwater in a utility excavation is an incomplete pathway for building construction workers and trespassers since these receptors will not be accessing on-site shallow groundwater in a utility excavation. All of the on-site pathways are incomplete for construction phase recreators for the same reasons given above in the current land use discussion.

6.1.3 Future Land Use

Future land use is described in Section 3.0. There is little uncertainty about the imminent redevelopment of the Site given the nature of existing plans, agreements and commitments made by Port leadership, City of Olympia leadership and other stakeholders.

Potential human receptors that were considered for future land use were urban residents (for instance, condominium or apartment dwellers living above ground-level retail), commercial workers (for instance, workers in ground-level retail), utility maintenance workers (for instance, workers conducting maintenance on existing utilities), and recreators (for instance, recreational users of the Hands On Children's Museum, the public plaza, and the East Bay of Budd Inlet). It should be noted that the future urban residential exposure scenario is more conservative and therefore protective for the other similar exposure scenarios such as hotel guests. It should also be noted that trespassers are not potential receptors because access to the Site after redevelopment will not be restricted. Based on the CSEM, complete or potentially complete exposure pathways (pending further evaluation) for these potential receptors during future land use are:

- **Urban Residents**:
  - Incidental ingestion of soil
  - Dermal contact with soil
  - Inhalation of particulates
  - Inhalation of vapors
  - Ingestion of drinking water from on-site groundwater wells
  - Dermal contact with drinking water from on-site groundwater wells
- **Commercial Workers**:
  - Incidental ingestion of soil
  - Dermal contact with soil
  - Inhalation of particulates

    - Inhalation of vapors
    - Ingestion of drinking water from on-site groundwater wells
    - Dermal contact with drinking water from on-site groundwater wells
- **Utility Maintenance Workers**:
    - Incidental ingestion of soil
    - Dermal contact with soil
    - Inhalation of particulates
    - Inhalation of vapors
    - Ingestion of drinking water from on-site groundwater wells
    - Dermal contact with on-site groundwater in a utility excavation
- **Recreators**:
    - Incidental ingestion of soil
    - Dermal contact with soil
    - Inhalation of particulates
    - Inhalation of vapors
    - Ingestion of drinking water from on-site groundwater wells
    - Incidental ingestion of off-site surface water
    - Dermal contact with off-site surface water
    - Consumption of seafood from East Bay

Based on existing information, other potential exposure pathways are not complete in the CSEM during future land use for the following reasons:

- Soil to surface water is an incomplete pathway for all potential receptors following redevelopment since it is expected that the Site will be covered by buildings, pavement, and other features that minimize transport from soil to surface water.
- Dermal contact with drinking water from on-site groundwater wells is an incomplete pathway for utility maintenance workers and recreators since this pathway is based on routine showering with water from on-site drinking water wells.
- Incidental ingestion of on-site groundwater in a utility excavation is an incomplete pathway for all potential receptors since this pathway is based on activities in which water is routinely near the mouth (for instance, swimming).
- Dermal contact with on-site groundwater in a utility excavation is an incomplete pathway for urban residents, commercial workers, and recreators since these receptors will not be accessing on-site shallow groundwater in a utility excavation.
- The surface water as drinking water pathway is incomplete for all receptors since the marine water in the East Bay of Budd Inlet is not suitable for use as a domestic water supply in accordance with WAC 173-340-730(2)(b)(ii).

- The groundwater to surface water/sediment pathway is not applicable for urban residents, commercial workers or utility maintenance workers because the exposure routes (incidental ingestion of surface water, dermal contact with surface water and consumption of seafood) are based on recreational pursuits. In addition, the future recreator exposure scenario is more conservative and therefore protective for other future human receptor scenarios with respect to the groundwater to surface water/sediment pathway.

6.2 ECOLOGICAL EXPOSURE PATHWAYS

The potential pathways for ingestion, dermal contact, and inhalation of COPCs by terrestrial ecological organisms are potentially complete pending further evaluation. The potential pathways for ingestion and dermal contact of COPCs by aquatic ecological organisms are potentially complete pending further evaluation of future groundwater and seep data.

7.0 SUPPLEMENTAL REMEDIAL INVESTIGATION DATA OBJECTIVES AND TASKS

Based on data gaps identified from evaluating preliminary RI data and comments received from Ecology, additional data is required to complete the RI. This section and Tables 1 through 3 describe the collection of this additional data. The details of the proposed exploration locations, sample selection and testing rationale are summarized in Tables 1 and 2 (soil and groundwater, respectively). Table 3 outlines rationale for additional groundwater monitoring at existing and proposed Site monitoring wells. These tables have specific references and responses to Ecology comments (Ecology February 5, 2008). Locations of proposed soil explorations and monitoring wells are shown on Figures 16 and 17, and are shown on Figure 18 relative to potential historic source areas, COPCs, and historic shorelines. Figure 19 shows the planned maximum depths of excavation for installing infrastructure (sewer, storm and water lines) at the Site. The proposed depths of the utilities and width of the infrastructure are also presented on the geologic cross-sections (Figures 7a through 7f). The reader is referred to these tables and figures to understand the details of the sampling and testing program. The locations of explorations and samples may change, with Ecology's approval, based on results after completing the first phase of explorations (see Section 7.2). The remainder of this section outlines the objectives and tasks associated with this supplemental RI.

Proposed New Soil Explorations Include
• 22 Direct-push Borings • Up to five new monitoring wells (part of 22 direct-push borings) • Testing D/F from 12 borings • Eight Phase I explorations to be completed Fall 2008 to support development of Infrastructure Interim Action Plan

The supplemental remedial investigation has seven main objectives:

1. Provide a direct response to Ecology's concerns regarding additional characterization of soil contamination at specific locations. Because of gaps in the existing data, there is some uncertainty regarding the nature and extent of identified soil contamination at some locations. The supplemental soil sampling will provide data to characterize the horizontal and vertical extent of soil contamination at these locations.
2. Locate suspected artesian wells and obtain information necessary to evaluate feasibility, costs and approach to decommission these wells. Suspected locations of these artesian wells are identified on Figures 4 and 20 and discussed in Appendix B. Actual decommissioning of confirmed artesian wells will be discussed in the IAP or a separate plan that will be submitted to Ecology for

approval. The affect of decommissioning artesian wells on the shallow aquifer will be assessed by measuring ground water levels and sampling/testing of groundwater.

3. Use additional soil characterization to supplement existing information regarding fill history and soil types.

4. Provide additional information on the extent of D/F concentrations that have been detected in shallow soil at the Site. The supplemental sampling locations were selected to provide D/F data that will be used to:

    - Evaluate the vertical and horizontal extent of D/F in soil;
    - Characterize soil in the infrastructure corridor; and
    - Additionally characterize soil on Parcels 2, 3, 4, 5, 6, 7 and 9.

5. Conduct quarterly groundwater monitoring for at least one year. More than one year of monitoring may be needed, depending on the length of time it takes for water levels to stabilize after artesian wells are decommissioned. Sampling of groundwater and seeps will not start until water levels have stabilized following decommissioning of the artesian wells. If the artesian wells are not located, quarterly groundwater monitoring will start after installation of the new monitoring wells.

Proposed Groundwater Monitoring, Sampling, and Testing Includes
• At least one year of quarterly groundwater monitoring. • Sampling of 17 (plus 5 new wells, if installed) Groundwater Monitoring Wells for all COPCs in first sample event after artesian wells are decommissioned. • Verify if four seeps represent groundwater. If deemed to be groundwater seeps, the seeps will be sampled. • Monitoring shallow groundwater wells for the presence of LNAPL.

    Each quarterly monitoring event will include measuring the depth to groundwater, evaluating the groundwater flow direction, and obtaining groundwater samples for chemical analytical testing. Groundwater analytical testing will consist of an initial round for all COPCs from all wells. The number of wells and COPCs analyzed will be reduced during subsequent monitoring events based on the results from the previous sampling events to focus ion potential compliance wells and wells where COPCs exceed the screening criteria. Evaluating the potential for floating free-phase product (light nonaqueous phase liquids [LNAPL]) in areas where petroleum concentrations in soil exceed screening criteria is part of the groundwater monitoring program.

    If, after the artesian wells are abandoned, water levels do not drop below the top of the well screens in monitoring wells located in these areas, it may be necessary to install new monitoring wells with shallower screen intervals. This Workplan includes the installation of up to five new shallow-screened monitoring wells.

6. Provide data necessary to assess the risks to human and ecological receptors.

7. Provide information to facilitate evaluation of cleanup action alternatives in the FS.

7.1 IDENTIFICATION OF DATA NEEDS

Data gaps identified from preliminary RI sampling locations indicate the need for additional data as follows:

- Horizontal and vertical delineation of existing contaminant exceedances in soil.
- Additional soil chemical analytical coverage on parcels with limited data.
- Characterize the nature and extent of D/F in soil.
- Impact of leakage from artesian wells on groundwater flow and quality in shallow aquifer.

The supplemental data will be used to:

1. Complete and augment the CSMs for contaminant transport and site exposure pathways.
2. Provide information to evaluate COPC fate and transport. This information will include testing for soil physical properties such as total organic carbon (TOC) and grain size.
3. Complete and augment understanding of groundwater, including groundwater flow direction, gradient and fluctuations, and groundwater chemistry before and after decommissioning of the artesian wells.
4. Complete the risk modeling, using additional soil chemical analytical data, soil physical properties and groundwater data as above.
5. Provide information to support infrastructure construction project planned for early 2009.
6. Provide information to support a future feasibility study and cleanup action(s).

7.2 PROJECT PLANNING AND SCHEDULE

Field work for the supplemental RI will be conducted in phases. The initial phase of the RI will be completed in Fall 2008 in order to provide data critical to the planning of the infrastructure improvement project. The initial phase includes completing eight explorations located in or near the infrastructure corridor. The initial eight exploration locations include borings DP27, DP30, DP32, DP33, DP34, DP36, DP38, and DP40, which are also highlighted on Table 1. The initial phase will also include locating suspected artesian wells, as described in Appendix B. All proposed exploration locations and infrastructure corridors are shown on cross-sections A through F (Figures 12a - 12f) and Figures 16 and 17. A health and safety plan (HASP) for use by GeoEngineers field personnel is included as Appendix E of this RI work plan. Subsequent phases of field work will be completed after data from the first phase has been evaluated and after decommissioning of the artesian wells.

Phase I field work is expected to take one week to complete. It will take an additional four weeks for chemical testing and validation of test results.

Phase II (explorations not included in Phase I and all new monitoring wells) is expected to take two weeks to complete plus four weeks to receive and validate analytical results.

The first groundwater monitoring event will occur after water levels have stabilized following decommissioning of the artesian wells. Each monitoring event is expected to take one week to complete, plus four weeks to receive and validate analytical results.

7.3 SAMPLE COLLECTION AND ANALYSIS

Sampling methods and procedures are presented in the Sampling and Analysis Plan (SAP) included as Appendix D. The SAP includes the quality assurance project plan (QAPP).

7.3.1 Quality Assurance/Quality Control

Quality assurance/quality control (QA/QC) procedures and standards that will be implemented during the supplemental RI and subsequent compliance groundwater monitoring activities are presented in the SAP/QAPP (Appendix D). The purposes of the SAP and QAPP are to describe sampling protocol, analysis and quality control procedures that will be implemented to produce chemical and field data that are representative, valid and accurate for use in evaluating the effectiveness of the data collection.

8.0 DEVELOPMENT OF CLEANUP LEVELS AND REMEDIATION LEVELS

To-date MTCA Method A or Standard Method B cleanup levels have been used as a reference for evaluating analytical chemistry results. However, as part of the RI Report, PIONEER Technologies Corporation will develop Site soil cleanup levels, Site soil remediation levels and groundwater screening levels based on an updated CSEM that accounts for data collected pursuant to this RIWP. Input parameters for cleanup level and remediation level calculations will be obtained from Ecology's Cleanup Levels and Risk Calculations (CLARC) database, as appropriate.

8.1 IDENTIFICATION OF COPCS

COPCs will be identified based on analytes that are detected in at least one soil or groundwater sample above MTCA cleanup levels based on unrestricted land use, and are not attributable to off-site sources.

Based on existing data (GeoEngineers 2007), the on-site COPCs are:

- arsenic
- benzo[a]pyrene
- cadmium
- lead
- 2,3,7,8-tetrachloro dibenzo-p-dioxin (2,3,7,8-TCDD)
- total naphthalenes
- TPH-D
- TPH-G
- TPH-MO

Regarding the above COPC list, it should be noted that:

- Bis (2-ethylhexyl) phthalate, which is a ubiquitous plasticizer that has been detected in some soil and groundwater samples to date (GeoEngineers 2007), is not be considered a COPC because its presence is most likely the result of sample collection and analysis procedures rather than a release from the Site.
- The cleanup and screening levels for total cPAHs and total D/F will be calculated based on TEFs relative to acceptable levels for benzo[a]pyrene and 2,3,7,8-TCDD, respectively, in accordance with WAC 173-340-708(8).
- TPH-G cleanup and screening levels will likely be based on TPH-G without benzene because benzene has not been detected in any soil or groundwater sample to date above its MTCA Method A cleanup levels in Table 740-1 or Table 720-1 (GeoEngineers 2007).
- Additional COPCs may be identified based on data collected pursuant to this RIWP.

8.2 SOIL CLEANUP LEVELS BASED ON UNRESTRICTED LAND USE

MTCA regulations require implementation of an institutional control (IC) remedy at a minimum whenever COPCs are present above MTCA cleanup levels based on an unrestricted land use exposure scenario. As a result, soil cleanup levels based on an unrestricted land use exposure scenario will be developed for Site COPCs in accordance with WAC 173-340-740 even though an unrestricted land use exposure scenario is not consistent with the CSEM presented in Section 6. It is anticipated that this tier of Site soil cleanup levels will be used to delineate which portions of the Site do not require further action and which portions will require a formal cleanup remedy (for example, an IC remedy at a minimum).

8.3 SOIL CLEANUP LEVELS AND REMEDIATION LEVELS

Risk-based soil cleanup levels and/or remediation levels will be developed for the Site based on an updated CSEM that accounts for data collected pursuant to this RIWP. These levels will be calculated for Site COPCs using procedures in WAC 173-340-357, -708, -740, and -745 with reasonable maximum exposure assumptions for receptors exposed via complete exposure pathways. It is anticipated that this tier of Site soil cleanup levels will be used to determine whether certain remedial alternatives are protective of human health and the environment based on actual land use. In addition, these risk-based levels will likely be used as remediation levels for determining locations in which certain remedial actions are required.

8.4 GROUNDWATER SCREENING LEVELS

Arsenic and TPH-D are the only potential groundwater exceedances to date (GeoEngineers 2007), and the single TPH-D detection at the Site (MW13) may be from an off-site source. MTCA Method A groundwater cleanup levels (which are not necessarily the same as the lookup values in MTCA Table 720-1) will be calculated in accordance with WAC 173-340-720(3) and -730(2) for use as groundwater screening levels. These screening levels will assist in the evaluation of potential exposure pathways (for example, soil to groundwater, groundwater as drinking water, vapor intrusion and groundwater to surface water) in the RI Report. If necessary, Site groundwater cleanup levels will also be developed.

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses								Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
				NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]		
1. Additional characterization is needed to define the extent of soil contamination at the site. The aerial and vertical extent of soil contamination needs to be further defined in the vicinity of DP02 and DP04 (including westward beneath Jefferson Street and on adjacent offsite parcels if necessary) and north of DP18.	TPH-D, TPH-MO, arsenic, and cadmium in the 2-6 feet interval were the only COPC exceedances at DP04. These COPCs have been delineated laterally in this interval to the northeast and south with MW08 and DP03, respectively. A new soil boring will be advanced northwest of DP04 to complete the lateral delineation of COPC screening level exceedances in the 2-6 feet interval. Soil samples will also be obtained from beneath existing railroad tracks to be removed during infrastructure construction activities. The railroad tracks are currently embedded in the asphaltic pavement along Jefferson Street and we expect that the section beneath the pavement will consist of railroad ties supporting the rail and ballast material (typically 3 feet of crushed rock) supporting the ties. Soil samples will be collected at the soil/ballast interface. We will analyze soil collected beneath the ballast material for cPAHs (using EPA Method 8270C), TPH, and metals to assess potential residual soil contamination associated with the ties.	DP37	0-2										
			2-6	x [a]	X	X	x		x	X			light sand fill
			6-10	X	X	X	x			X			dark sand fill
	TPH-MO in the 2-6 feet interval was the only significant COPC exceedance at DP02. This COPC has been delineated laterally in this interval to the north and southeast with DP03 and DP16, respectively. A new soil boring will be advanced southwest of DP02 to complete the lateral delineation of the TPH-MO screening level exceedance in the 2-6 feet interval. A sample from 10 to 14 feet from the monitoring well boring for MW25S will be tested for TPH-MO to evaluate the vertical extent of this COPC identified in previous samples from DP02. Proposed shallow screen interval for MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04. Soil samples from below the railroad tracks will also be collected and analyzed from DP38 and analyzed for PAHs. PAHs will be tested in sample from 10 to 14 foot depth interval in the boring for MW25S to evaluate the vertical extent of this COPC identified previously at DP02 and DP16. One sample from DP38 will be tested for dioxins/furans to evaluate soil within the infrastructure corridor.	DP38	1-3				x		x				
			4-6	x	X	X	x	x	x		x		light sand fill
			6-10	X	X	X	x	x	x		x	9	Silt or dark sand fill
		MW25S	0-2										
			2-6										
			6-10	x	X	X	X		X				Silt or dark sand fill
			10-14	x	X	X	X		x				Silt or dark sand fill
	TPH-MO in the 10-14 feet interval was the only significant potential COPC exceedance at DP18. This COPC has been delineated latreally in the vadose zone and saturated zone with MW03, MW16, and DP17 but has not been delineated laterally north of DP18. Soil samples from the boring for MW23S will provide this information. Proposed screen interval for MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18. TPH-MO will be tested in MW-23S at the 6 to 10 and 10 to 14 foot intervals to evaluate the vertical extent of TPH-MO identified previously at DP18.	MW23S	0-2										
			2-6										
			6-10	x [a]	X	X	X		X				light sand fill
			10-14	x	X	X	X		X				light sand fill
2. Additional characterization is needed to define the extent of soil contamination at the site. The vertical extent of contamination needs to be defined in the vicinity of DP06 and DP08.	TPH-G in the 2-6 feet interval was the only significant potential COPC exceedance at DP06 and needs to be defined at depth and to the south. TPH-D and TPH-MO in the 2-6 feet interval were the only significant potential COPC exceedances at DP08. TPH-D and TPH-MO exceedance was identified in the 2-6 feet interval in DP-13. The vertical extent of gasoline, diesel and oil contaminated soil has been delineated with DP24, DP15, DP14, MW-5, MW-8 and MW-10. MW24S, along with the other proposed and existing wells, will be used to evaluate the leaching to groundwater pathway via empirical demonstration per WAC 173-340-747(9) an (10)(c). Proposed shallow screen interval for MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	MW24S	4-6	X	X	X	X		X				
			6-10	X	X	X	X		X				
	Evaluate lateral extent of TPH-D and MO identified previously at DP08 and DP13. Evaluate lateral extent of gasoline exceedance at DP08 and DP13.	DP39	0-2	X	X	X	X		X				
			2-6	x [a]	X	X	X		X				dark sand fill
	Lateral and vertical extent of dioxins/furans by TP03. Evaluate thickness of pre-1891 fill. Collect data to support management of soil that will be excavated as part of the infrastructure improvements. DP40 will also help evaluate the extent of diesel and oil contamination previously observed in DP13 and DP08 at 2-6 feet.	DP40	0-2	x	X	X	x	x	x				light sand fill
			2-4	x	X	X	x	x	x		x		light sand fill
			4-6	x	X	X	x	x	x		x	3.5	dark sand fill
3. Additional characterization is needed to define the extent of soil contamination at the site. The aerial extent of contamination has not been defined in the vicinity of MW19.	TPH-G in the 2-6 feet interval was the only potential COPC exceedance at MW19. Two soil borings (DP28 and the boring for MW21s) will be located near MW19 to evaluate the aerial extent of the screening level exceedance of TPH-G at MW19 in the 2-6 feet interval. The proposed screen interval (2 to 7 feet bgs) for MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19. Moreover, a soil boring advanced to the west of MW19 in response to Ecology Comment #7 (i.e. DP27) will also be sampled for TPH-G in the 2-6 feet interval to provide lateral delineation to the west. To address Ecology comment 7, if evidence of burned wood or ash is observed in boring DP28, which is located on the northern edge of parcel 1 near the former Refuse Fire Area, a sample of this material will be analyzed for dioxins and furans.	DP28	0-2	X	X	X	X						
			2-6	X	x	X	X						light sand fill
		MW21S	0-2										
			2-6		x [a]								light sand fill

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
4. Additional characterization is needed to define the extent of soil contamination at the site. Area of Concern (AOC) #16 (pad mounted transformer) needs to be evaluated. Soil samples should be collected from this area for petroleum hydrocarbons and PCBs. The location of well MW04 does not appear to be close enough to this AOC to be adequate.	One new boring will be advanced and sampled within AOC 16 as recommended by Ecology. The targeted depth for the soil sample collected from this boring is the elevation of the former transformer pad located in AOC 16. The sample from this boring will be analyzed for PCBs and mineral oil range petroleum hydrocarbons (NWTPH-Dx).	DP35	0-2										
			2-6	x						x			gravel fill
5. Parcel 1 needs to be assessed. AOCs #43 through 48 and #50 have not been adequately assessed. Also, the northern portion of Parcel 1 needs to be assessed.	The first sentence of this comment does not apply because the East Bay Redevelopment Project Area only includes the northwest portion of Parcel 1. A new boring (DP36) located in the right-of-way of Olympia avenue adjacent to the northwest portion of Parcel 1will address Ecology's concern regarding the northern portion of Parcel 1. However, the primary purpose of this boring is to evaluate soil conditions to assist in planning of future infrastructure improvements in this area and evaluate residual concentrations of COPCs in an area where historical sources were not located.	DP36	1-3					x					gravel fill
			2-6	x	x	X	x	X					silt
			6-10					X				9	silt
6. Additional characterization of dioxins/furans is needed. As shown in the report, concentration of dioxins/furans that exceed the MTCA Method B Soil Cleanup Level of 11 nanograms per kilogram (ng/kg) or parts per trillion (ppt), expressed as a Total Toxicity Equivalency Factor (TEF), were observed at all four locations tested for this constituent. The reported TEF values from these locations range from 57.9 to 645 ng/kg. Because the highest concentration (TP02) is near the east property line and near an adjacent public walking path and grassy area, additional samples for dioxins/furans should be collected in this adjacent area. Also, an analysis of wind direction should be performed to help predict locations that may show higher dioxin concentrations.	New boring DP33 will provide vertical profile of dioxins/furans concentrations near TP2. Selection of sample locations based on prediction of wind direction is not necessary because the proposed dioxins/furans sample locations (as outlined in this table) provide spatial coverage across the site.	DP33	0-2					x	x	x			gravel fill
			2-4				x	x	x		x		gravel fill
			4-6				x	x	x				light sand fill
			6-8					x				9	light sand fill
7. Additional characterization of dioxins/furans is needed. Parcel 7 is located adjacent to the Refuse Fire Area (Area of Concern #1), which is a potential source of dioxins/furans contamination. Additional soil samples for dioxins/furans analyses should be performed in Parcel 7. These samples will provide additional dioxins/furans data for the site and may help to determine whether AOC #1 was a source.	Additional samples which address Ecology's comment 7 will be collected and tested for dioxins/furans from a boring advanced near AOC 1 (DP27) and a boring advanced at the northern edge of Parcel 7 (DP28). In addition, DP27 will be sampled for TPH-G to address gasoline contamination identified in soil at MW-19 (see response to Ecology Comment #3). Samples from boring DP27 will also be analyzed for PAHs to evaluate the lateral and vertical extent of cPAHs identified in soil samples from MW-20, near the Refuse Fire Area. Note that Parcel 8, which is adjacent to the northwest portion of the Site, is being addressed by LOTT Alliance through Ecology's Voluntary Cleanup Program.	DP27	0-2					x	x	x			light sand fill
			2-4		x	X	x	x	x		x		light sand fill
			4-6				x	x	x		x		silt
			6-8				x	x				3	silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
8. Additional characterization of dioxins/furans is needed. Section 4.3.1 states that "dioxin testing appears to indicate that the historical working surface (depth of about 2 feet below existing grade) is impacted." Please provide more detail on what is meant by "historical working surface" and how it is distinguished. According to the Supplemental Site Use History report, the boiler house (AOC #17) operated circa 1932 and the power house (AOC #22-24) operated from at least 1941 through 1958. Was 2.0 feet below current grade the historical grade for these facilities? If so, what evidence is there for this? Dioxin samples were collected at the 2.0 foot depth at AOC #17, at the 3.5 depth at AOC #22-24, and at the 1.5 and 2.0 foot depths at the two randomly selected locations. It is recommended that additional samples be collected at AOC #17 so that a concentration verses depth profile can be determined.	The "historical working surface" is the sometimes woody and compacted historical grade where industrial buildings were located and operations were conducted on the property prior to later filling and grading. Based on our review of historical information the working surface is located about 1 to 4 feet below existing grade, however it can be difficult to identify in borings due to similarity in lithology of fill in this depth interval. Because of Ecology's questioning of the historical working surface and difficulty in determining its exact location in borings, a more appropriate rationale for the location of explorations where vertical profiles for dioxins/furans testing is as follows:1) complete a profile (DP33) adjacent to previous sample with high dioxins concentrations (TP02) and 2) complete a profile that represents temporal fill sequences.	See DP 33 (Comment 6) and borings and "Additional Explorations" rationale below.										
9. Additional characterization of groundwater contamination, flow direction, and gradient is needed. Groundwater monitoring wells MW-1 through MW·11 and MW-14 were installed with their screened interval submerged below the water table. Wells that monitor for light non-aqueous phase liquids (LNAPL, such as petroleum hydrocarbons) should be completed so that their screen straddles the water table. Therefore, to accurately evaluate whether groundwater is contaminated from LNAPL constituents, it will be necessary to install additional groundwater monitoring wells with screens that extend above the water table at selected locations where the existing monitoring wells are not adequate. Please present your proposed new well locations to us for review and approval.	Given the general lack of dissolved-phase petroleum constituent detections in the groundwater samples collected from existing MWs (as well as the relatively low TPH soil concentrations detected in soil samples collected from areas with suspected hydrocarbon contamination), it is unlikely that the typical placement of the screened intervals straddling the water table would result in measurable LNAPL thicknesses or even a screening level TPH exceedance at any MW at this site. Nonetheless, five shallow MWs (MW21S through MW25S) with screens straddling the water table are proposed to address this comment. MW21S and MW24S are discussed in the responses to Ecology Comments #2 and #3, respectively. Proposed MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06. MW23S and MW25S are discussed in the response to Ecology Comment #1. This Ecology comment is further addressed by in the Groundwater Monitoring Plan. Based on recent comments from Ecology (9/22/08 Ecology comment letter and subsequent discussion), because artesian wells at the Site may be influencing shallow groundwater, an attempt will be made to locate and decommission or otherwise mitigate leakage from the artesian wells. If the artesian wells are found and decommissioned, water levels and the need for shallow monitoring wells will be reevaluated.	MW22S	No analysis of soil samples unless field observations indicate the presence of contamination. Anticipated screened interval is 1-6 feet bgs.									
Additional Explorations													
Additional explorations to evaluate the nature and extent of contamination, including dioxins/furans. These explorations will provide data related to: a) regional area background concentrations of dioxins/furans and metals not related to a site release, b) management of soil that will be excavated as part of the infrastructure improvements, and c) evaluation of COPC distribution in different fill types and spatial coverage related to general extent of COPCs.	Evaluate extent of lead and PAHs at DP11.	DP29	0-2						x				light sand fill
			2-6				x						silt or gravel
			6-10				x						silt or gravel
			10-14						x				silt or gravel
	Evaluate dioxins/furans in fill (1891 to 1908 time interval), evaluate dioxins/furans in soil within the infrastructure corridor, and provide additional sampling data for parcel 9.	DP30	0-2				x	x					light sand fill
			2-4				x	x	x				light sand fill or silt
			6-8				x	x (if silt)				9	light sand fill or silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration	Sampling Depth Interval (ft bgs)[1]	Soil Analyses								Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
		Boring (DP) Well (MW)		NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]		
	Locations DP31 and DP41 are selected to obtain dioxins/furans data from soil not associated with any AOC source. This data will be used to evaluate dioxins/furans concentrations related to regional dioxin sources and regional background levels as it is possible that detected concentrations of dioxins/furans and metals in soil samples collected to date are attributable to an area or regional background rather than a site release. DP31 is located on parcel 6 in an area where no historical sources (AOCs) were located and the underlying fill is from the 1948 to 1975 time period. DP41 is located on parcel 2 in an area where no historical sources (AOCs) were located and the underlying fill is from the post 1975 time period.	DP31	0-2					x					light sand fill
			2-6	x			x	x					light sand fill
		DP41	0-2					x					gravel fill
			2-6				x	x					silt
	Evaluate dioxins/furans in post-1975 fill within the infrastructure corridor. These data will assist with evaluating background conditions as well as inform waste characterization and disposal associated with the excavated infrastructure corridor soils.	DP32	0-2					x			x		gravel fill
			2-6				x	x	x		x		gravel fill
			6-9					x				9	gravel fill
	Evaluate dioxins/furans in fill (1891 to 1908 time interval) near infrastructure corridor and on Parcel 4.	DP34	0-2					x					light sand fill
			2-6	X	X	X	x	x	x		x		light sand fill
			8-10	X	X	X	x	x	x			10	light sand fill or gravel
	These borings are located on Parcel 4 and the locations were selected to gather information to support soil characterization during construction activities associated with the Children's Hands on Museum.	DP26	0-2				X	x	X				light sand fill
			2-6					x	X				silt or light sand fill
			6-10				X	X					
		DP42	0-2				X	x					gravel fill
			2-6				X	x					light sand fill
			6-10				X	X					

Notes:

Blank boxes (no X) indicate that soil samples will be collected from the specified depth intervals and held for potential analyses by the analytical laboratory

Shaded cells indicate explorations and samples that will be collected in first phase of investigation

[1] Samples will be collected approximately every 2 feet in soil borings for field screening and potential chemical analyses. Discrete soil samples will be obtained from within the depth intervals shown in this column (rather than composite samples.) The depth ranges represent the intervals that a sample will be analyzed for the COPCs identified in the Soil Analyses columns. Additional samples may be analyzed if field observations indicate the presence of contamination.

[2] The metals listed; arsenic, cadmium and lead, represent metals that had concentrations exceeding screening levels in one or more locations. Some soil samples collected from the infrastructure corridor may also be analyzed for "RCRA 8" metals to provide data needed by soil disposal facilities. The RCRA metals include arsenic, barium, cadmium, chromium, lead, mercury, selenium & silver.

[3]TOC= total organic carbon. TOC and other physical soil properties such as grain size may also be analyzed at various locations for the possibility of establishing site specific Method B cleanup levels.

[a] Also analyze for EPH.
[b] Also analyze for total organic carbon
x = sample collected for analytical testing. Red X = additional analytical testing requested by Ecology in it's September 22, 2008 comment letter.
As = Arsenic, Cd = Cadmium, Pb = Lead
PCBs = Polychlorinated biphenyls
HCID = Hydrocarbon Identification test (NWTPH-HCID)
NWTPH-Dx = Diesel-range and motor oil-range total petroleum hydrocarbons
TPH-MO = motor oil-range petroleum hydrocarbons
D/F = Dioxins and furans
NWTPH-G = Gasoline-range total petroleum hydrocarbons

TABLE 2
PROPOSED NEW MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

				Existing Well Data[2]		
Well I.D.	**Purpose**	**Installation Method/Well Diameter**	**Proposed Well Screen Interval (BGS-feet)[1]**	**Nearest Existing well**	**Highest DTW**	**Lowest DTW**
MW21s	MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19.	Direct push/1-inch	2 to 7	MW19	3.47	3.78
MW22s	MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06.	Direct push/1-inch	1 to 6	MW6	0.84	1.14
MW23s	MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18.	Direct push/1-inch	4 to 9	MW16	5.41	6.35
MW24s	MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	Direct push/1-inch	2.5 to 7.5	MW10	3.48	3.8
MW25s	MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04	Direct push/1-inch	2 to 7	MW7 and MW8	5.0 & 2.55	5 & 2.62

Notes:

Based on recent comments from Ecology, because artesian wells at the Site may be influencing groundwater levels, an attempt will be made to locate and decommission the artesian wells. If the artesian wells are found and decommissioned, the need for shallow monitoring wells will be reevaluated.

[1]Across water table with one foot of screen above predicted high water table elevation and four feet of screen below this elevation, subject to approval by Ecology and issuance of well construction variance.

[2] Based on depth to water measurements collected August 2007 and July 2008 during low and high tides.

bgs=below ground surface

DTW = depth to water in feet as measured from top of well casing. Top of well casings for referenced wells is approximately at ground surface.

Seep 3 [10]	Groundwater/surface water interface													NA	x	x	x	x	x	x	x	--	--
Seep 4 [10]	Groundwater/surface water interface													NA	x	x	x	x	x	x	x	--	--

Notes:

[1]Dissolved metals to be tested in addition to total metals at locations where metals exceedances have been measured. Also test these samples for aluminum and iron (Al and Fe^{3+}) to represent suspended clay particles. Results to potentially be used for evaluating sorption of COPCs.

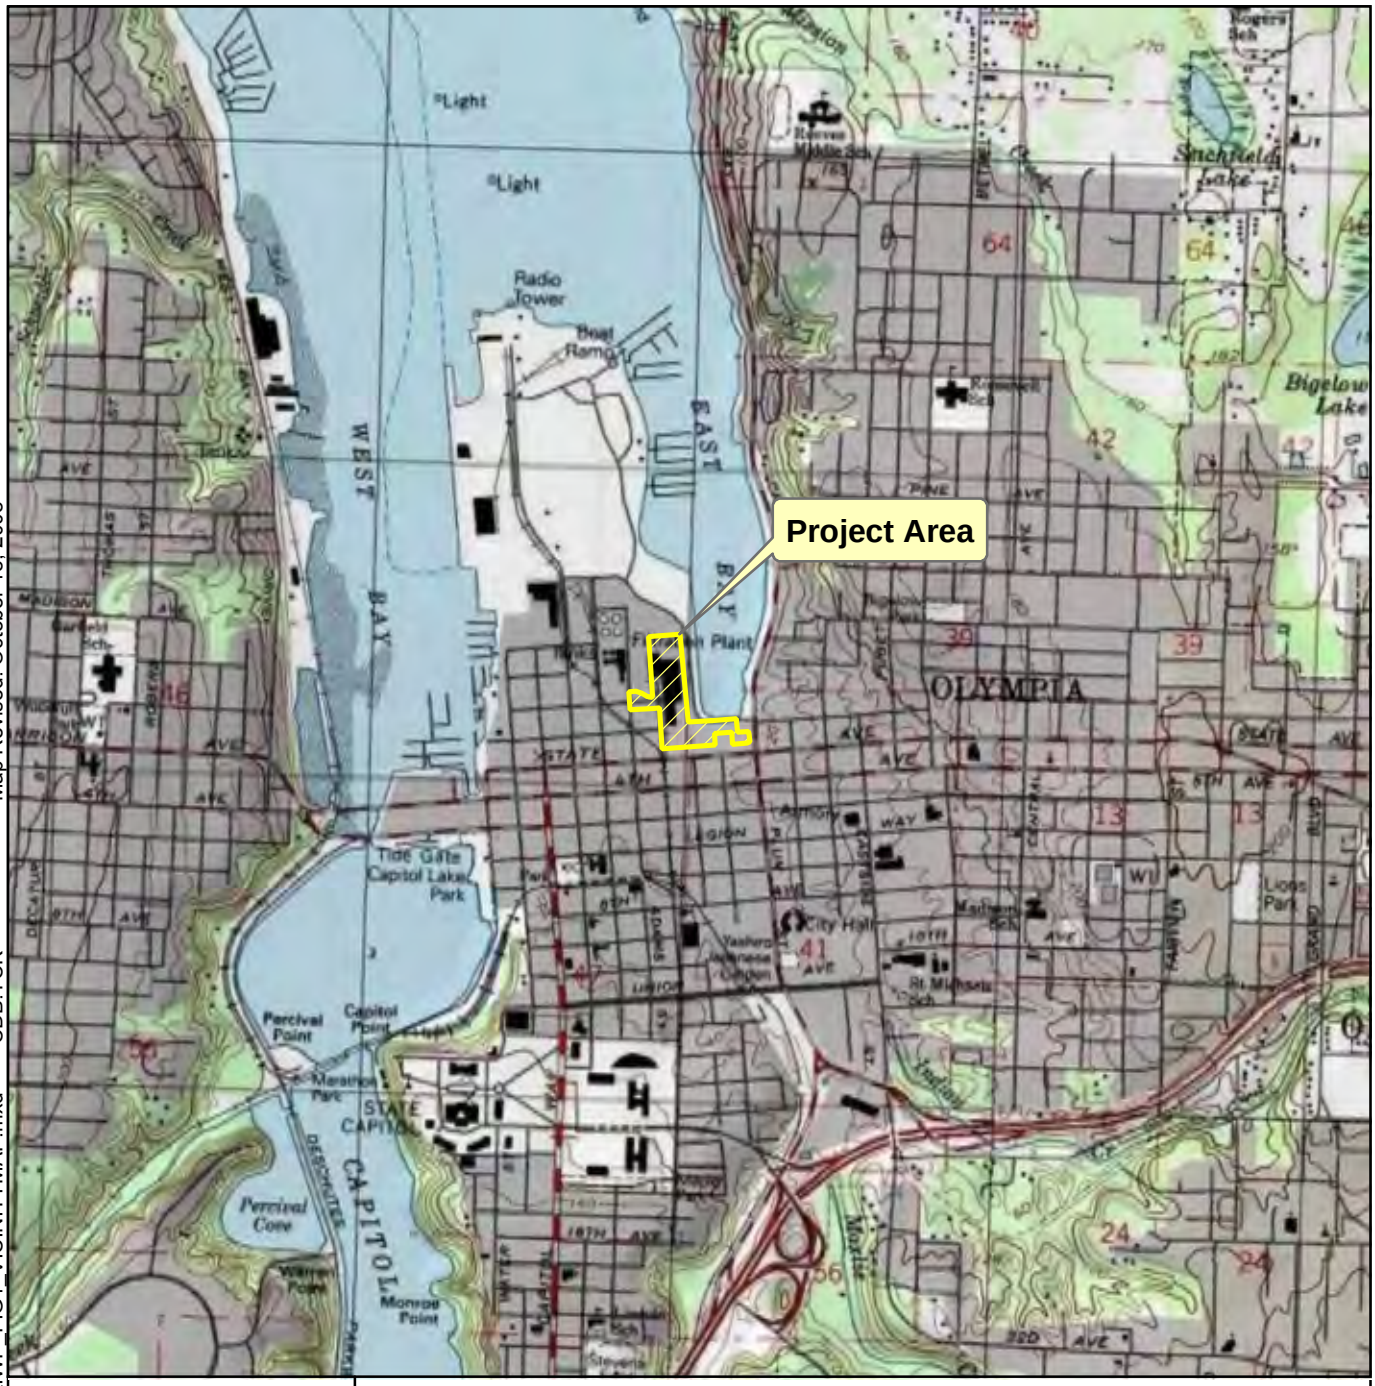
[2]MW05, MW12, MW16 and MW18 are downgradient wells between the subject property and East Bay. These wells will be considered for potential future compliance wells.

[3]MW04, 05, 06, 07, 08, 10 were sampled and tested July 13, 2007 for diesel-range hydrocarbons only.

[4]MW01 through MW10 were installed in January 2007. MW11 through MW20 were installed in July and August 2007.

[5]MW14 was not sampled in 2007 because other monitoring wells surrounding MW14 were sampled and tested.

[6]Note on SVOCs. The only SVOC exceedances were cPAHs, therefore only cPAHs will be analyzed, rather than the full SVOC list.



[7]Note on PCBs. PCBs have not been detected in any of the groundwater samples obtained from MW01 through MW20 at the site; nor have they been detected above soil screening levels. Therefore PCBs will only be tested at locations where low level detections of PCBs were detected in soil on Parcel 3 and near the former transformer location (MW04).

[8]Note on Dioxins/Furans. Dioxin/Furans were not detected in a groundwater sample obtained and tested from MW16 in August 2008. Dioxin sampling and testing approach is based on obtaining samples from potential source area wells that are also downgradient compliance wells (MW05 and MW16). If dioxins/furans are detected in groundwater at MW05 or MW16, then additional testing will be conducted at the other compliance wells (MW04, MW11, MW12

[9]This well will not be installed if water levels drop sufficiently after the artesian wells are decommissioned if the existing paired monitoring well screen is not totally submerged.

[10]Water from this seep area will only be sampled if it is determined to represent groundwater (see Section 5.4.2 of Sample and Analysis Plan)

x = sample collected for analytical testing
Y = Yes; N = No; NA = not applicable; "--" = Not tested
TPH-Gasoline by Ecology Method NWTPH-Gx
TPH-Diesel and Oil by Ecology Method NWTPH-Dx
VOCs (volatile organic compounds) by EPA Method 8260B
RCRA Metals (As, Ba, Cd, Cr, Pb, Ag, Se, Hg) by EPA Methods 6000/7000
PAHs (polycyclic aromatic hydrocarbons) by EPA Method 8270sim
PCBs (polychlorinated biphenyls) by EPA Method 8082
Dioxins/Furans by EPA Method 1613B
ORP = Oxidation Reduction Potential
DO = Dissolved Oxygen
Fe = Iron
Al = Aluminum
COPCs = contaminants of potential concern

Figure 15

Conceptual Site Exposure Model
Port of Olympia East Bay Site

Key

- ● Complete Exposure Pathway
- ◆ Potentially Complete Exposure Pathway (pending further evaluation)
- ○ Incomplete Exposure Pathway

File: Figure 15_Replacement.vsd

NOTES:
(1) Although this pathway is likely not complete based on existing data, it is considered potentially complete for all relevant receptors pending further evaluation.
(2) Even though there are no current drinking water wells that are impacted by releases to site soil and it is unlikely that a suitable future water well could be installed in the shallow groundwater at the site, use of shallow groundwater as a future drinking water source is considered potentially complete for all relevant receptors pending further evaluation.
(3) Also applies to suspected ponded groundwater during current land use and shallow groundwater in a utility excavation during the construction phase and/or future land use.
(4) This exposure scenario is a reasonable maximum exposure scenario and is more conservative and therefore protective of other similar exposure scenarios. For instance, the exposure assumptions for current trespassers are more conservative than other current exposure scenarios, such as a scenario for people who access boats stored on-site. Likewise, all three off-site recreator scenarios are more conservative than other off-site human exposure scenarios; the two on-site worker and two on-site trespasser scenarios during the construction phase are more conservative than other on-site construction phase exposure scenarios; the future urban residential scenario is more conservative than the hotel guest exposure scenario; the future utility maintenance worker exposure scenario is more conservative than other human exposure scenarios for future subsurface work; etc.
(5) Current and construction-phase recreators are off-site only since there is no current recreational land use on-site and access will be restricted during the construction phase.
(6) Although future soil-based exposures would be incomplete if exposure barriers were installed as necessary in accordance with current development plans, the pathway is considered potentially complete for all relevant receptors pending further evaluation.

GREYLOCK CONSULTING GROUNDWATER STUDY

GREYLOCK
CONSULTING LLC
Water Resources & Environmental Services

August 21, 2008

Ms. Joanne Snarski
Port of Olympia
915 Washington St. NE
Olympia, WA 98501

Re: **Groundwater Flow During High and Low Tides**
Port of Olympia East Bay Site
Olympia, Washington

Dear Ms. Snarski:

This letter documents the results of our evaluation of groundwater elevation data obtained from the East Bay Site in Olympia, Washington.

Background

The Port of Olympia (Port) is in the process of negotiating an Agreed Order with the Department of Ecology (Ecology) for an interim action at the East Bay Site (Figure 1). Various environmental studies have previously been performed at this Site (GeoEngineers, 2007a,b). Ecology has requested that the Port identify a hydrogeologic conceptual model for the site. A key component in understanding the hydrogeology of the site is to identify flow directions and gradients at varying tidal stages. This study evaluates groundwater flow directions and gradients at the site during a low and high tide on July 16, 2008.

Site

The East Bay Site (Site) is located on the south end of the Port Peninsula adjacent to the East Bay of Budd Inlet in Olympia, Washington (Figure 1).

The site consists of approximately 13.6 acres of mixed use and commercial properties. The project area is generally flat. The northern and western portions of the site are paved with asphalt, and the southern and eastern portions of the site are covered with crushed rock and bare land.

Most of the site has historically been used for commercial and light industrial purposes, including wood process and milling operations and warehousing. For a detailed discussion of the history of the Site, please see GeoEngineers' Draft Remedial Investigation/Feasibility Study (GeoEngineers, 2007b).

P.O. Box 23254, Federal Way, WA 98093 • Office: (253) 941-0654 • Cel: (253) 266-2838 • Fax: (253) 941-2705

Subsurface Soils

Predominant subsurface soils (0 to 15 ft bgs) at this site consist of coarse sand and gravel with occasional silt. Thin silt lenses and wood layers have also been observed in near surface soils. Significant filling has occurred at this site, therefore much of the shallow subsurface soils are non-native.

Monitoring Wells

Twenty shallow monitoring wells were previously constructed on and adjacent to the site by others. The monitoring wells vary in diameter from 1- to 2-inches, and vary in depth from 8 to 15 ft bgs. The effective depths of wells were measured on July 16, 2008 and are provided in Tables 1 and 2.

Groundwater

Water levels were collected at the site on July 16, 2008 by Greylock and its subconsultant Stemen Environmental Inc. (Stemen). Water levels were collected within 1 hour and 19 minutes of a low tide of – 1.4 ft Mean Low Low Water (MLLW), and within 1 hour of a high tide of +14.4 ft MLLW. Water level measurements collected during a low tide are provided in Table 1. Water level measurements collected during a high tide are provided in Table 2. Shallow groundwater at the site occurs at depths ranging from 1.05 ft to 9.40 ft below the top of casing (TOC) of monitoring wells. Ponded water was also observed on the surface of the ground in the vicinity of monitoring well MW-06. Based on a conversation with Al Kulp of the Port, we understand that artesian flow is directed toward MW-6 via a pipe. It is not known where the artesian flow originates.

July 16, 2008 Low Tide Monitoring Event

On July 16, 2008 water levels were collected at the site between 11:35 AM and 12:42 PM. A low tide of -1.4 ft MLLW was recorded at 11:25 AM. As shown on Figure 2, groundwater flow direction varies across the site. The majority of groundwater flow across the site is directed toward Budd Inlet. However, at the southwestern end of the site, a groundwater mound was measured in the vicinity of MW-14 and MW-06. At this location, groundwater flows in all directions from the southwest corner of the site outward, as shown in Figure 2. At the northwestern end of the site a groundwater high exists near MW-17. Groundwater flow is generally directed from the area of MW-17 toward the north, east and south across the site.

Groundwater gradients vary significantly across the site during a low tide. Gradients range from approximately 0.003 ft per ft near the center of the site to approximately 0.08 ft per ft toward the shoreline, near MW-12.

July 16, 2008 High Tide Monitoring Event

On July 16, 2008 water levels were collected at the Site between 7:20 and 8:19 PM. A high tide of +14.4 ft MLLW was recorded at 7:21 PM. As shown on Figure 3, groundwater flow direction varies across the site. In general, groundwater flow directions are similar to those measured during the low tide event earlier in the day. The majority of groundwater flow is directed toward Budd Inlet. At the southwestern end of the site, a groundwater mound is present in the vicinity of MW-14 and MW-06. Also, a groundwater high is present in the vicinity of MW-17.

Groundwater gradients vary significantly across the site during a high tide. Gradients range from approximately 0.003 ft per ft near the northern part the site to approximately 0.04 ft per ft at the southern part of the site, near MW-06.

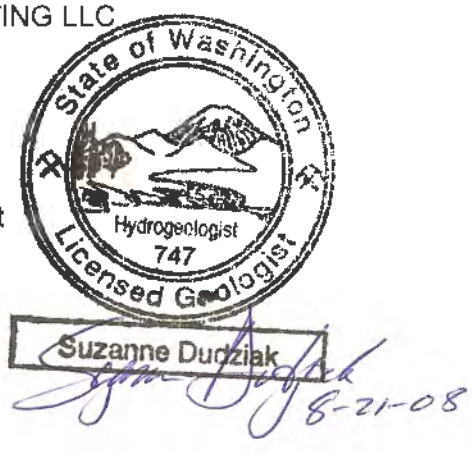
Tidal Effect

Table 3 provides a summary of the change in groundwater elevation from low to high tide on July 16, 2008. Only two of twenty wells (MW-12 and MW-18) showed greater than one foot of change in elevation between the measuring periods. MW-12 and MW-18 are screened in coarse fill and are within approximately 110 ft of Budd Inlet.

Water levels in the majority of wells showed minimal elevation change with change in tide. With the exception of an area of coarse fill within 110 ft of the shoreline, tidal fluctuation does not significantly affect groundwater flow patterns at the site.

Discussion

Based on two groundwater monitoring events collected during a low and high tide event on July 16, 2008, the majority of groundwater flow across the site is directed toward Budd Inlet. Two groundwater highs were observed during both monitoring events: At the southwestern end of the site and at the northwestern end of the site. These groundwater highs are likely caused by leakage from artesian wells. Also, at the southwestern end of the site, recharge from ponded water likely contributes to the groundwater high in this area.



Limitations

This report is based upon the application of scientific principles and professional judgment to certain facts with resulting subjective interpretations. Professional judgments expressed herein are based upon the facts currently available within the limits of the existing data, scope of work, budget, and schedule. We make no warranties, expressed or implied, including, without limitation, warranties are to the fitness of the site for a particular purpose.

If you have any questions regarding this report, please call me at (253) 941-0654.

Sincerely,

GREYLOCK CONSULTING LLC

Suzanne Dudziak
Principal Hydrogeologist

APPENDIX B
ARTESIAN WELL LOCATING

GeoEngineers

October 22, 2008

Port of Olympia
915 Washington Street NE
Olympia, Washington 98501

Attention: Joanne Snarski

Subject: Artesian Wells
Port of Olympia
East Bay Redevelopment Project
Olympia, Washington
File No. 0615-034-07

INTRODUCTION

This letter responds to the Washington State Department of Ecology's (Ecology) request that the Port of Olympia (Port) locate and decommission artesian wells suspected to be located on the East Bay Redevelopment Site (Site). Ecology made this request in their September 22, 2008 comment letter on the draft Remedial Investigation Work Plan. Ecology wants the artesian wells decommissioned because it is speculated that leakage from these wells may be influencing groundwater in the shallow aquifer. However, this is complicated by the fact that very little is known about the condition or location of the wells. This letter summarizes what we know about these wells and provides procedures to try to locate them.

The objectives of the study described in this letter are: (1) verify what wells exist on the Site; (2) identify the location of the wells; (3) identify the size and condition of the top of the well casings; and (4) collect data necessary to evaluate the feasibility and cost of decommissioning the wells. There is uncertainty as to the number and location of these wells because most are buried, and existing data provide conflicting information regarding their locations and whether they have already been destroyed.

The information to be collected in this study is needed to determine the feasibility, methods, and costs of decommissioning the artesian wells. This letter does not include procedures to decommission wells.

SUMMARY OF WHAT IS KNOWN ABOUT THE ARTESIAN WELLS

Based on the information we reviewed there are potentially six artesian wells located on the Site. Information about these artesian wells is summarized in the table below and Figure 1, attached. Information sources and descriptions of the wells are discussed below.

Unknown	41	77	1.5	1.5	25	Parcel 3
Unknown	70	84	10	3-4	>150	Jefferson Street
Unknown	73	73	3	3	Unknown	Parcel 9

Notes:
Source: Table excerpted from March 26, 1999 Robinson & Noble, Inc. LOTT Technical Memorandum 1204, Thurston County Health Department 1994 Artesian Well Survey, information from Field Book 17, information from Port personnel, and/or information obtained during GeoEngineers' 2008 study.
gpm - gallons per minute

Artesian wells in the vicinity of the Site were identified in a 1994 survey of the City of Olympia map compiled by Thurston County Health Department (Attachment A). This map shows artesian wells currently present in the city of Olympia area. A study conducted in 1999 (Robinson and Noble, 1999) also investigated flowing artesian wells in downtown Olympia, but did not identify artesian wells on the Site. The 1999 report includes information (copies of pages) from "Field Book 17" that shows the location and diameter of some wells. The date of the field book and accompanying sketch is unknown. Based on these three information sources, there were potentially six wells located on the Site; 74, 75, 76, and 77 on Parcel 3, 84 on Parcel 5, and 73 on Parcel 9.

According to the 1994 survey, six artesian wells (numbered 73 and 74 through 77, and 84) formerly were located on the Site. According to the 1999 report, three (wells 74 through 76) of the six artesian wells located on the Site were destroyed during demolition of the former Olympia saw mill. The "destroyed" wells (74 through 76) appear to be in the approximate locations of three wells identified in Field Book 17 (wells A, B, C at location number 47) that were associated with former Olympic Veneer (1924) operations at the Site. The 1999 report does not describe how the wells were destroyed. Little information was presented in the 1999 report regarding the three remaining on-site wells, 73, 77 and 84. Well 77 apparently was identified at the northeast corner of State Avenue and Jefferson Street. This well was also associated with the former Olympic Veneer facility that was number 41 in Field Book 17. No information was identified regarding well 84, except for the approximate location at the east side of Jefferson Street and Thurston Avenue. Well 84 was not located or discussed in the 1999 report. Well 84 is in the approximate location of a well identified in the site sketch from Field Book 17 as Number 70 (see approximate location in Figure 1). The "Field Book 17" sketch indicates Well 73 is a 3-inch-diameter, 2-gallon-per-minute well located between Adams and Jefferson Streets.

According to Port personnel, one of the artesian wells located on Parcel 3 may be present on the Site in the southeast corner of the dry boat storage yard. There is a 2 foot by 2 foot section in the City sidewalk that is thought to be the location of a well that is capped but not decommissioned. The well casing may be one inch or less and the depth is unknown. In addition, a surface pipe has been described in the center of Parcel 3 with water flowing out. Information from Port personnel indicates this pipe is connected to a drain field installed by the Port under the gravel lot, rather than to a well. Evidence for suspected locations of artesian wells is the presence of a groundwater mound on Parcel 3 that coincides with the reported locations of artesian wells in the 1994 and 1999 studies (see Figure 1).

PROPOSED PROCEDURES TO LOCATE ARTESIAN WELLS

Geophysical methods followed by test pit explorations will be used to locate the six suspected wells at the site. Because the locations, conditions, depths and casing sizes are not known, the geophysical methods will include various methodologies to attempt to locate the wells. Geophysical methods will include ground penetrating radar (GPR), magnetometers and/or electromagnetics (time domain). Geophysical anomalies will be ground-proofed with shallow test pits to verify the presence or absence of well materials. The areas targeted for geophysics are shown as the hatched orange areas in Figure 1.

1. Subsurface utilities will be identified in the target areas using one-call service and a private locating company. It is important to identify buried utilities because they can affect interpretation of the geophysical data, in addition to the requirement to identify utilities prior to digging. The utility locating service company will also try to locate/trace the pipe visible on Parcel 3 that may be associated with an artesian well.

2. A geophysical survey will be conducted in target areas. Potential methods employed will include GPR, magnetometer and electromagnetic methods (specific details of the methods are included as Attachment B). The survey will be conducted on a close-grid spacing in the vicinity of the former well locations on Parcel 3, Parcel 5 and Parcel 9 as shown on Figure 1.

3. Test pits will be completed by a combination of hand digging and backhoe in the vicinity of identified geophysical anomalies to verify the presence or absence of buried objects. It is anticipated that the wellheads / well caps are buried between ground surface and approximately 4 feet below ground surface (bgs). Excavation of the test pits has the risk of causing uncontrolled flow of water by damaging well casings or removing overburden that may be currently controlling flow from a well. To reduce this risk, digging will be conducted slowly with constant monitoring for evidence of a well. If water does start flowing onto the ground surface digging will stop and the test pit will be backfilled (see item 5 below). If the source of water can be identified as a well casing an attempt will be made to cap the casing.

    a. Excavated soil will be temporally stockpiled on plastic. Stockpiles will be covered with plastic if left overnight and drainage from the stockpiles will be directed into the associated test pit.

    b. Test pits will be backfilled with excavated material. The back-hoe bucket will be decontaminated in-between locations to prevent cross-contamination.

    c. Field screening will be conducted on excavated soil for evidence of petroleum contamination. GeoEngineers' field geologist will also document the type of soil and fill encountered.

4. If a well casing is identified we will try and document its size, type of construction material, general condition, presence or absence of a cap, presence or absence of water leakage from around the casing or from the casing. Assuming water leaking from a well can be controlled so it does not flow uncontrolled onto the ground surface, the well casing will be left exposed to allow well drilling abandonment contractor(s) to come to the site and gather information they need to assess the feasibility of abandoning the well.

    a. The locations of all suspected well casings identified in this study will be surveyed.

    b. Well casings identified below the ground surface will be protected by placing a larger diameter conductor casing or drain pipe around the casing and extend this casing to the ground surface. The test pit will be backfilled around this protective casing. Other

protective measures might be used instead of the protective casing depending on input from well abandonment contractors. The objective is to protect the well casing in a manner that facilitates further assessment.

c. Surplus excavated material will be temporarily stockpiled onsite until an appropriate disposal facility is designated or it is determined the material can be reused onsite.

5. A second field event will be needed for wells/test pits where water flowed uncontrolled onto the ground surface. Prior to re-exposing the well arrangements will be made to manage the water, based on flow estimates and other information obtained during the initial test pit investigation. The specific method for managing water will depend on the flow. Potential water management methods being considered include using vacuum trucks, pumping water into temporary storage tanks, or routing of water from the trench to another portion of same parcel for infiltration.

LIMITATIONS

We have prepared this letter for the exclusive use of the Port of Olympia, their authorized agents and regulatory agencies. This letter is not intended for use by others and the information contained herein is not applicable to other sites. No other party may rely on the product of our services unless we agree in advance, and in writing, to such reliance. This is to provide our firm with reasonable protection against open-ended liability claims by third parties with whom there would otherwise be no contractual limits to their actions.

It is always possible that contaminants remain in areas that were not observed, sampled or tested.

Within the limitations of scope, schedule and budget, our services have been executed in accordance with our general agreement with the Port of Olympia and generally accepted environmental science practices in this area at the time this report was prepared. No warranty or other conditions, express or implied, should be understood.

GeoEngineers

ATTACHMENT B

GEOPHYSICAL METHODS (SOURCE: GLOBAL GEOPHYSICS)

GEOPHYSICAL METHODS

GROUND PENETRATING RADAR

The GPR method uses electromagnetic pulses, emitted at regular intervals by an antenna to map subsurface features. The electromagnetic pulses are reflected where changes in electrical properties of materials occur such as changes in lithology or where underground utilities are present. The reflected electromagnetic energy is received by an antenna, converted into an electrical signal, and recorded on the GPR unit. The data is recorded and viewed in real time on a graphical display that depicts a continuous profile or cross-section image of the subsurface directly beneath the path of the antenna.

The depth of penetration of the GPR signal varies according to antenna frequency and the conductivity of the subsurface material. The depth of subsurface penetration with GPR decreases with an increase in the frequency of the antenna and an increase in soil conductivity. Low frequency antennas (50 to 500 MHz) provide the best compromise between obtaining good subsurface penetration and resolution.

The data at this site will be collected using Geophysical Survey Systems, Inc. (GSSI) SIR 2000 GPR system with an antenna having a center frequency of 200-500 MHz. The data will be digitally recorded for post processing.

MAGNETOMETER

This instrument is used to measure variations in the magnetic field of the Earth, including local distortions or anomalies of the field caused by ferrous objects or minerals. In general, the magnitude of the magnetometer response is proportional to the mass of the ferrous object. A single drum can be detected to a depth of approximately 15 to 20 feet, and a 4-inch-diameter steel pipeline can be detected to a depth of approximately 10 feet. Non-ferrous metals, such as copper and aluminum cannot be located with a magnetometer.

A Geometrics Cesium G858G magnetometer will be used.

TIME-DOMAIN ELECTROMAGNETICS (EM61)

The EM61 is a time-domain electromagnetic metal detector capable of detecting buried metal objects. Ground control is established on site as a local grid system. The geophysical data are collected along regular grid lines and stations at a density that is appropriate for the size of the potential target.

Laboratory Results for: Method 1613B/0615-034-02

Dear Jay:

Enclosed are the results of the sample(s) submitted to our laboratory on July 30, 2008. For your reference, these analyses have been assigned our service request number **E0800739**.

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. In accordance to the NELAC 2003 Standard, a statement on the estimated uncertainty of measurement of any quantitative analysis will be supplied upon request.

Please contact me if you have any questions. My extension is 2957. You may also contact me via email at JFreemyer@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Jane Freemyer
Project Manager; GC/HRMS

Project:	0615-034-02	**Date Received:**	07/30/08
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed in adherence to the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier II. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Two water samples were received for analysis at Columbia Analytical Services on 07/30/08. One sample was put on Hold status, as requested.

The following discrepancies were noted upon initial sample inspection: no custody seals on cooler(s). The exceptions are also noted on the cooler receipt and preservation form included in this data package.

The samples were received at 2°C in good condition and are consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

Data Validation Notes and Discussion

B flags – Method Blanks

The Method Blank EQ0800341-01/U129371 contained low levels of 123478-HcCDF at or below the Method Reporting Limit (MRL).

The associated compounds in the samples are flagged with 'B' flags.

Y flags – Labeled Standards

Samples that had recoveries of labeled standards outside the acceptance limits are flagged with 'Y' flags on the Labeled Compound summary pages. In all cases, the signal-to-noise ratios are greater than 10:1, making these data acceptable.

Approved by Xiangqiu Liang **Date** 8/19/08

Xiangqiu Liang, Laboratory Director

The sample extracted originally had recoveries of labeled standards outside the acceptance criteria. The sample was re-extracted, met the acceptance criteria and was reported.

MS/DMS

EQ0800341: Laboratory Control Spike/Duplicate Laboratory Control Spike (LCS/DLCS) samples were analyzed and reported in lieu of an MS/DMS for this extraction batch.

Detection Limits

Detection limits are calculated for each congener in each sample by measuring the height of the noise level for each quantitation ion for the associated labeled standard. The concentration equivalent to 2.5 times the height of the noise is then calculated using the appropriate response factor and the weight of the sample. The calculated concentration equals the detection limit.

The TEQ Summary results for each sample have been calculated by CAS/Houston to include:

- The 2005 World Health Organization Reevaluation of Human and Mammalian Toxic Equivalency Factors for Dioxins and Dioxin-Like Compounds (M. Van den Berg et al., Toxicological Sciences 93(2):223-241, 2006)
- Non-detected compounds are not included in the 'Total'

Approved by Xiangqiu Liang **Date** 8/19/08

Abbreviations, Acronyms & Definitions

Cal	Calibration
Conc	CONCentration
Dioxin(s)	Polychlorinated dibenzo-p-dioxin(s)
EDL	Estimated Detection Limit
EMPC	Estimated Maximum Possible Concentration
Flags	Data qualifiers
Furan(s)	Polychlorinated dibenzofuran(s)
g	Grams
ICAL	Initial CALibration
ID	IDentifier
Ions	Masses monitored for the analyte during data acquisition
L	Liter (s)
LCS	Laboratory Control Sample
DLCS	Duplicate Laboratory Control Sample
MB	Method Blank
MCL	Method Calibration Limit
MDL	Method Detection Limit
mL	Milliliters
MS	Matrix Spiked sample
DMS	Duplicate Matrix Spiked sample
NO	Number of peaks meeting all identification criteria
PCDD(s)	Polychlorinated dibenzo-p-dioxin(s)
PCDF(s)	Polychlorinated dibenzofuran(s)
ppb	Parts per billion
ppm	Parts per million
ppq	Parts per quadrillion
ppt	Parts per trillion
QA	Quality Assurance
QC	Quality Control
Ratio	Ratio of areas from monitored ions for an analyte
% Rec.	Percent recovery
RPD	Relative Percent Difference
RRF	Relative Response Factor
RT	Retention Time
SDG	Sample Delivery Group
S/N	Signal-to-noise ratio
TEF	Toxicity Equivalence Factor
TEQ	Toxicity Equivalence Quotient

Data Qualifier Flags – Dioxin/Furans

- **B** Indicates the associated analyte is found in the method blank, as well as in the sample

- **C** Confirmation of the TCDF compound: When 2378-TCDF is detected on the DB-5 column, confirmation analyses are performed on a second column (DB-225). The results from both the DB-5 column and the DB-225 column are included in this data package. The results from the DB-225 analyses should be used to evaluate the 2378-TCDF in the samples. The confirmed result should be used in determining the TEQ value for TCDF.

- **E** Indicates an estimated value – used when the analyte concentration exceeds the upper end of the linear calibration range

- **J** Indicates an estimated value – used when the analyte concentration is below the method reporting limit (MRL) and above the estimated detection limit (EDL)

- **K** EMPC - When the ion abundance ratios associated with a particular compound are outside the QC limits, samples are flagged with a 'K' flag. A 'K' flag indicates an estimated maximum possible concentration for the associated compound.

- **U** Indicates the compound was analyzed and not detected

- **Y** Samples that had recoveries of labeled standards outside the acceptance limits are flagged with 'Y'. In all cases, the signal-to-noise ratios are greater than 10:1, making these data acceptable.

- **ND** Indicates concentration is reported as 'Not Detected'

- **S** Peak is saturated; data not reportable

- **Q** Lock-mass interference by ether compounds

Sample Acceptance Policy

Custody Seals (desirable, mandatory if specified in SAP):

- ✓ On outside of cooler
- ✓ Seals intact, signed and dated

Chain-of-Custody documentation (mandatory):

- ✓ Properly filled out in ink & signed by the client
- ✓ Sign and date the coc for CAS/HOU upon cooler receipt
- ✓ Coc must list method number
- ✓ If no coc was submitted with the samples, complete a CAS/HOU coc for the client

Sample Integrity (mandatory):

- ✓ Sample containers must arrive in good condition (not broken or leaking)
- ✓ Sample IDs on the bottles must match the sample IDs on the coc
- ✓ The correct type of sample bottle must be used for the method requested
- ✓ The correct number of sample containers received must agree with the documentation on the coc
- ✓ The correct sample matrix must appear on the coc
- ✓ An appropriate sample volume or weight must be received

Temperature Preservatives (varies by sample matrix):

- ✓ Aqueous and Non-aqueous samples must be shipped and stored cold, at 0 to 6°C
- ✓ Tissue samples must be shipped and stored frozen, at -20 to -10°C
- ✓ Air samples can be shipped and stored at ambient temperature, ~23°C
- ✓ The sample temperature must be recorded on the coc
- ✓ Notify a Project Chemist if any samples are outside the acceptance temperature or have compromised sample integrity – the client must decide re: replacement sample submittal or continue with the analysis

Cooler Receipt Form, CRF (mandatory):

- ✓ Cooler receipt forms must be completed for each coc & SR#
- ✓ Sample integrity issues must be documented on the CRF
- ✓ A scan of the carrier and the airbill number must be recorded in CAS LIMS

Sample Integrity Issues/Resolutions (mandatory):

- ✓ Sample integrity issues are documented on the CRF and given to the Project Chemist for resolution with the client
- ✓ Client resolution is documented in writing (typically email or on the CRF) and filed in the project folder(s)

SAMPLING AND ANALYSIS PLAN AND QUALITY ASSURANCE PROJECT PLAN REMEDIAL INVESTIGATION WORK PLAN EAST BAY REDEVELOPMENT, PORT OF OLYMPIA OLYMPIA, WASHINGTON FOR PORT OF OLYMPIA

1.0 INTRODUCTION

This Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP) describe sample collection, handling and analysis procedures associated with the Remedial Investigation Work Plan (RIWP) for the Port of Olympia's (Port) 13-acre East Bay Redevelopment Site (Site). The Site is located in Olympia, Washington, as shown in Figure 1. This SAP must be used in conjunction with the RIWP and the project-specific Health and Safety Plan (HASP).

Detailed descriptions of the field sampling procedures are provided in this document. Site conditions may make it necessary to modify these procedures. Any variations or modifications that become necessary during the investigation will be coordinated with Port personnel, the Washington State Department of Ecology (Ecology) and other involved parties, as appropriate. Variations or modifications implemented during the investigation and the reason for the modification will be documented in field records.

This SAP describes field activities, sampling equipment, sampling locations and procedures that will be used during investigations at the Site. This SAP also includes a QAPP (Section 11), which identifies quality assurance/quality control (QA/QC) procedures that will be implemented during field sampling activities and laboratory analyses.

2.0 PURPOSE AND SCOPE

The purpose of this SAP is to present the detailed procedures that will be used to obtain samples during the supplemental remedial investigation (RI). The objective of this sampling is to provide information to:

- Characterize the nature and extent of contamination at the Site;
- Assess the potential risk to human and ecological receptors; and
- Provide the information that will allow selection of cleanup action alternatives.

Rationale for sample locations and depths and monitoring wells are described in Tables 1 through 3.

Activities to be performed by GeoEngineers during the RI include the following:

1. Update the Project HASP and SAP for use by GeoEngineers' personnel during the RI.
2. Retain public and private utility locating services to identify and locate underground utilities in the exploration areas in coordination with the Port.
3. Retain a concrete coring contractor to core through paved surfaces, as necessary.
4. Monitor the advancement of soil explorations using direct-push and/or hollow-stem auger techniques to depths specific to proposed sample locations. If field screening indicates

contamination is present at the target total depth for a boring, the boring will be advanced until field screening indicates contamination is not present.

a. Soil borings will be located by measuring from known previously surveyed features (roads, existing monitoring wells, etc) and GPS readings.

b. Samples of soil will be collected continuously for the total depth of each boring. Samples for potential chemical analyses will be collected approximately every two feet. Soil will be visually classified in the field according to the Unified Soil Classification System. Contacts between soil lithologies and fill episodes, if feasible, will also be described.

c. Groundwater monitoring wells may be constructed in five borings as described in Table 2.

5. Obtain soil samples as specified in this SAP and the RIWP. Field screening will be performed on each sample using visual, water sheen and headspace vapor screening methods. The field screening results will be used as a general guideline to approximate the vertical extent of petroleum-related contamination in the soil samples. In addition, screening results will be used to aid in the selection of soil samples to be submitted for chemical analysis.

6. Explore the locations and nature of water seeps along the shoreline embankment and collect data to determine if the seeps represent groundwater.

7. Obtain groundwater samples from existing and new monitoring wells for chemical analytical testing using low-flow sampling methodology. Measure depth to water using an electric water level indicator.

a. Collect water samples from seeps if the seeps represent groundwater.

8. Contain soil cuttings, purge water and decontamination water in steel drums and store the drums in a secure location designated by the Port to await off-site transport and disposal. The drums will be labeled according to standard GeoEngineers' practice.

9. Submit soil and groundwater samples to a subcontracted chemical analytical laboratory for chemical analysis. The chemical constituents for each sample have been determined based on existing data and assumptions of the chemicals of potential concern (COPCs) present. Sample locations, depth intervals, and COPCs are described in Tables 1 through 3. The chemical analysis may include one or more of the following:

a. Gasoline-, diesel- and motor oil-range petroleum hydrocarbons by Ecology Methods NWTPH-Gx and NWTPH-Dx,

b. Metals by U.S. Environmental Protection Agency (EPA) Method 6000/7000 series,

c. Volatile organic compounds (VOCs) by EPA Method 8260B,

d. Semivolatile organic compounds (SVOCs) including carcinogenic polycyclic aromatic hydrocarbons (cPAHs) by EPA Method 8270 SIM,

e. Polychlorinated biphenyls (PCBs) by EPA Method 8082, and

f. Dioxins/furans by EPA Method 1613B or Method 8290.

Tables 4 and 5 summarizes the target analytical reporting limits and analytical methods that will be used for soil and groundwater.

10. Document sample methodology and sample locations using detailed field logs.

11. Use database and geographic information system (GIS) technologies to manage chemical analytical data and sample locations.

3.0 PROJECT SCHEDULE

Field work for the supplemental RI will be conducted in phases. The initial phase of the RI will be completed in Fall 2008 in order to provide data critical to the planning of the infrastructure improvement project. The initial phase includes completing eight explorations located in or near the infrastructure corridor. The initial eight exploration locations include borings DP27, DP30, DP32, DP33, DP34, DP36, DP38, and DP40, which are also highlighted on Table 1. The initial phase will also include locating suspected artesian wells, as described in Appendix B of the RI Workplan. Subsequent phase of field work will be completed after data from the first phase has been evaluated and after decommissioning of the artesian wells.

4.0 ROLES AND RESPONSIBILITIES

This section outlines the individuals directly involved with the RI. Work performed under this SAP will be in cooperation with the Port.

Key personnel for this project are as follows:

Position	Name	Affiliation	Telephone Number
Ecology Project Coordinator	Steve Teel	Washington State Department of Ecology	360-407-6247
Port Project Coordinator	Joanne Snarski	Port of Olympia	360-528-8061
Principal-in-Charge	David Cook	GeoEngineers, Inc.	206-728-2674
Project Manager	Jay Lucas	GeoEngineers, Inc.	206-239-3221

- The **Ecology Project Coordinator** is responsible for providing timely technical review and guidance regarding compliance with the Agreed Order (AO) and is responsible for overseeing implementation of the AO for Ecology.
- The **Port Project Coordinator** is responsible for administering the contract with the consultant and is responsible under the AO for overseeing implementation of the AO for the Port.
- The **Principal-in-Charge** works with the Project Manager and is responsible for project document QA/QC review.
- The **Project Manager** reports directly to the Port Project Coordinator and the Principal-in-Charge. The Project Manager is responsible for coordinating project activities and submitting deliverables to the Port. The Project Manager's duties consist of providing concise technical work statements for project tasks, selecting project team members, determining the degree of subcontractor participation, establishing and adhering to budget and schedule, providing technical oversight and providing review of all work.

5.0 FIELD PROCEDURES

The rationale, depths and chemical program for soil and groundwater samples are presented in Tables 1 through 6 of this SAP and are described in the RIWP. The soil and groundwater samples will be obtained and submitted to a Washington State accredited laboratory for chemical analysis.

Note that Sampling and Testing associated with the RI, as outlined in this SAP, includes a phased approach to facilitate early decisions regarding the infrastructure improvements and associated excavation. The phased explorations and testing approach are highlighted in Table 1 of this SAP.

5.1 UNDERGROUND UTILITY LOCATE

Prior to sampling activities, an underground utility locate will be conducted in the area of the proposed sample locations to identify any subsurface utilities and/or potential underground physical hazards.

5.2 SUBSURFACE SOIL SAMPLING

5.2.1 Sample Collection Method

Subsurface soil sampling will be conducted using a direct-push drilling rig equipped with a core barrel lined with disposable acetate sleeves. Soil samples will be obtained every two feet for potential chemical analytical testing and field screening, as described in Table 1. Samples obtained for chemical analytical testing will consist of approximately four- to six-inches of the soil core. The depth of each sample will be measured from the bottom of the sample interval. The depth to the groundwater table, if present, may also be measured at each sample location, using an electric water level indicator.

Samples to be analyzed for gasoline-range petroleum hydrocarbons and VOC analysis following EPA Method 5035A (Ecology 2004) will be obtained first. Samples obtained for non-volatile analyses will be obtained from the same general intervals as the volatile samples. Planned sample depths are based on results from earlier studies and are outlined in Table 1. Sample containers will be labeled in the field and stored in an iced cooler prior to and during shipment to the chemical analytical laboratory.

Sampling activities will be conducted by a GeoEngineers representative, and soil will be visually classified in the field according to the Unified Soil Classification System (USCS) and American Society for Testing and Materials (ASTM) Standard 2488.

Field personnel will record the sample locations using hand-held Trimble GeoXT global positioning system (GPS) units with sub-meter accuracy during sampling activities. Sub-meter accuracy standards will be used during data collection to record latitude and longitudinal data. A minimum of four satellites will be required for a position dilution of precision (PDOP) value of less than 6. Satellite elevation must be at least 15 degrees above the horizon, with a minimum signal-to-noise ratio (SNR) of 39 bBHz. GPS data collected in the field will be subsequently processed in the office using measurements from the nearest reference station to each collection point.

5.2.2 Sample Locations

Twenty-two new boring locations are planned and shown in Figures 2 and 3. The borings are placed in areas to further evaluate the lateral and/or vertical extent of contamination that has been identified in previous studies. The rationale for sample locations and depth intervals are described in Table 1.

5.2.3 Phase 1: Infrastructure Construction Corridor Sample Locations

Locations of eight borings are within utility corridors associated with the infrastructure improvements. These borings may be completed during an initial phase of exploration to accommodate the construction schedule. These borings are highlighted in Table 1 and Figure 2. Sampling in the infrastructure corridor will provide data to characterize soil that will be removed during excavation activities.

5.3 FIELD SCREENING

Field screening for evidence of possible contamination will be performed on soil samples obtained from the explorations. Field screening results will be recorded on the field logs, and the results will be used as a general guideline to delineate areas of possible contamination. Screening results will be used to aid in the selection of soil samples to be submitted for chemical analysis. The following screening methods will be used: (1) visual screening, (2) water sheen screening and (3) headspace vapor screening. Visual screening and water sheen screening are qualitative methods; therefore, precision, accuracy and detection limits are not quantified for these methods. Headspace vapor screening is a semi-quantitative method; however, precision and accuracy will not be quantified for this method. Instrument accuracy and detection limits are described below. Field screening results are site- and location-specific. The results may vary with temperature, moisture content, soil type and chemical constituent.

5.3.1 Visual Screening

The soil will be observed for unusual color and stains and/or odor indicative of possible contamination.

5.3.2 Water Sheen Screening

A portion of the soil sample will be placed in a pan containing distilled water. The water surface will be observed for signs of sheen. The following sheen classifications will be used:

Classification	Identifier	Description
No Sheen	(NS)	No visible sheen on the water surface
Slight Sheen	(SS)	Light, colorless, dull sheen; spread is irregular, not rapid; sheen dissipates rapidly
Moderate Sheen	(MS)	Light to heavy sheen; may have some color/iridescence; spread is irregular to flowing, may be rapid; few remaining areas of no sheen on the water surface
Heavy Sheen	(HS)	Heavy sheen with color/iridescence; spread is rapid; entire water surface may be covered with sheen

5.3.3 Headspace Vapor Screening

Headspace vapor screening will be performed on a portion of the soil sample placed into a resealable plastic bag. Ambient air will be captured in the bag; the bag will be sealed and then shaken gently to expose the soil to the air trapped in the bag. The bag will remain closed for approximately 5 minutes at ambient temperature before the headspace vapors are measured. Vapors present within the sample bag's headspace will be measured by inserting the probe of a photoionization detector (PID) through a small opening in the bag. A PID measures the concentration of organic vapors ionizable by a 10.6 electron volt (eV) lamp in parts per million (ppm) and quantifies organic vapor concentrations in the range between 0.1 ppm and 2,000 ppm (isobutylene equivalent) with an accuracy of 1 ppm between 0 ppm and 100 ppm. The maximum value on the instrument and the ambient air temperature will be recorded on the field log for each sample. The PID will be calibrated to 100 ppm isobutylene.

5.4 GROUNDWATER SAMPLING

5.4.1 Monitoring wells

Groundwater will be sampled from 17 existing and new monitoring wells for chemical analytical testing as shown in Table 3. Monitoring wells will be sampled using low-flow sampling methodologies, as described below.

- Prior to sampling, measure depth to water with an electric water level indicator.
- Purge groundwater from the monitoring wells using dedicated tubing, a peristaltic pump (or equivalent), a flow-through cell and water parameter analyzer (Horiba U-20). Purge monitoring wells using a flow rate between 100 and 500 milliliters per minute (mL/min) that does not create significant drawdown in the well. When field parameters have stabilized or at least three well volumes of water have been purged from the well, disconnect the flow-through cell and sample groundwater directly from down-well tubing, maintaining a low-flow pumping rate. Water quality parameters to be monitored during purging include: conductivity, dissolved oxygen, pH, salinity, total dissolved solids, turbidity, oxidation-reduction potential and temperature.
- Place each groundwater sample directly into a laboratory-prepared sample container, label the container, log the sample on the chain-of-custody and sample collection form, and place the container into a cooler with ice.

5.4.2 Groundwater Seeps

Greylock Consulting identified four seep locations along the shoreline during a low tide on July 16, 2008. These locations, as well as other seep locations that may be identified during site visits, will be evaluated to determine if they represent groundwater rather than surface water, irrigation water or discharge from buried pipes.

The evaluation will be based on several lines of evidence that will include:

- Physical observations of the proximity of the seeps to known utilities that could represent areas where water leaks from stormwater drains or from the fill around buried utilities.
- Explore the soil above the seeps to determine if the soil is saturated above the seepage point, and follow the saturation to its point of origin. This exploration will be conducted with hand digging equipment.
- Measure the temperature, salinity and conductivity of the water discharging from the seeps and compare these values to that representative of groundwater and of marine water. This will help determine if the seeps represent delayed drainage of sea water, rather than groundwater.
- Determine if the seeps originate at a higher elevation that the groundwater table. If a seep originates above the elevation of the groundwater table or high tide elevation that day, it is evidence that the seep does not represent groundwater. The elevation of the groundwater table will be based on water levels measured in the nearest monitoring well during the high tide and the low tide of that day's tidal cycle.

If water from an area of seepage is identified as groundwater, a representative sample will be collected for chemical testing as identified in Table 3. The sample will be collected by pushing a short PVC pipe into the seep so the water drains from the end of the pipe. Following insertion of the PVC pipe, a sample of the water will be collected after turbidity caused by the initial disturbance has descreased. Conductivity, temperature, and salinity water quality parameters will be measured as described above for the monitoring well samples. Up to four samples representative of groundwater seeps will be collected. The PVC pipe will be decontaminated prior to collection of each sample.

5.5 FIELD EQUIPMENT CALIBRATION PROCEDURES

Field equipment requiring calibration will be calibrated to known standards in accordance with manufacturers' recommended schedules and procedures for each instrument. If field equipment becomes inoperable, it will be replaced with a properly calibrated instrument.

6.0 CHEMICAL ANALYTICAL PROGRAM

All samples will be submitted to a Washington State accredited laboratory. Tables 1 and 3 summarize the chemical analyses for soil and groundwater samples from monitoring wells, respectively. Tables 4 and 5 summarize the target analytical reporting limits.

7.0 SAMPLE HANDLING AND CUSTODY REQUIREMENTS

The following procedures will be used when obtaining soil and/or groundwater samples during the investigation activities.

- Dedicated nitrile gloves will be worn when obtaining each sample, including quality control (QC) samples.
- Soil samples obtained for chemical analysis of gasoline-range petroleum hydrocarbons and VOCs will be obtained using EPA Method 5035A.
- Samples obtained for chemical analysis will be transferred into clean sample containers supplied by the analytical laboratory. Table 6 lists the sample containers to be used.
- Sufficient sample volume will be obtained for the laboratory to complete the method-specific QC analyses on a laboratory-batch basis.
- Sample labels will be completed for each sample following the procedures provided in this section. Immediately after the samples are obtained, they will be stored in a cooler with ice until they are delivered to the analytical laboratory.
- Standard chain-of-custody procedures will be followed for all samples obtained.

7.1 CUSTODY SEALS

Custody seals are signed and dated seals that are affixed to the lid of a shipping container (for example, cooler) and are used to indicate if the container has been opened before it reaches the intended recipient. Custody seals will be attached to containers by GeoEngineers personnel before they are transferred to the chemical analytical laboratory.

7.2 CUSTODY PROCEDURES

Chain-of-custody procedures will be used to track the possession of the samples from the time they are obtained in the field through analysis and final disposition. Each time the samples change hands, both the sender and receiver will sign and date the chain-of-custody record form. A chain-of-custody record form will be used to track possession of the samples and to document the analyses requested. The form will be completed at the end of each sampling day prior to transfer of samples off-site and will accompany the samples during transfer to the laboratory.

When the samples are shipped to the laboratory via common carrier, one copy of the chain-of-custody record form will be retained for project files, and the remaining copies will be enclosed in a plastic bag and secured to the inside of the cooler prior to shipment.

Upon receipt of the samples at the laboratory, the custody seals will be broken, the chain-of-custody form will be signed as received by the laboratory, and the conditions of the samples will be recorded on the form. The original chain-of-custody form will remain with the laboratory, and copies will be returned to the relinquishing party.

8.0 DOCUMENTATION OF FIELD ACTIVITIES

Daily field activities, including observations and field procedures, will be recorded on appropriate forms. The original field forms will be maintained in GeoEngineers' office files. Copies of the completed forms will be maintained in a sequentially numbered field file for reference during field activities. Photographic documentation of field activities will be performed as appropriate.

8.1 SAMPLE DESIGNATION

Each sample obtained during field activities will be identified by a unique sample designation. The sample designation will be included on the sample label. For soil samples, the designation also will be included with the corresponding sample information on the appropriate field log. For groundwater sampling from monitoring wells, the corresponding sample information will be recorded on the monitoring well sampling field sheet. The following sample designation system will be used for this project.

All samples will be assigned a unique identification code based on a consistent sample designation scheme. The sample designation scheme is designed to suit the needs of the field staff, data management and data users. All samples will consist of three components separated by a dash. These components are station code, date and sample interval. The sample designation scheme is as follows:

Station Code	Date	Sample Interval
SSnn	YYMMDD	XXX
MWnn	YYMMDD	W

The three components are described below.

8.1.1 Station Code

The station code component is a four-character code that uniquely identifies each sampling station. The station code component has two parts: a two-letter station designation ("SS" or "MW") followed by a sequential two-digit number component "nn." The two-letter "SS" designation will be determined by how the soil sample was obtained (for example, drilling method, grab) as described below. The sequential "nn" component will begin at 26 (that is, 26, 27, 28) to accommodate samples previously obtained at the Site during previous studies. For groundwater samples, the "MWnn" designation will correspond to the monitoring well number (for example, MW25S).

The station designations are:

- DP – Direct-Push
- SB – Soil Boring using Hollow-Stem Auger (HSA) Drilling Techniques
- TP – Test Pit
- GB – Grab Sample

8.1.2 Date

The date component is a six-character code that presents the date that the sample was obtained in the following format: year, month, day (YYMMDD).

8.1.3 Sample Interval

The sample interval component corresponds to sample depth for soil samples, and is a three-character code that identifies each sampling interval. Soil sample depth determinations will be made to the nearest 0.5 foot, with the depth determination representing *either* the sample collection point (for VOC) *or* the beginning of the sampling interval (that is, 050 will represent the 5- to 5.5-foot interval). For groundwater, a "W" will be used for the sample interval component.

8.1.3.1 Field Quality Control (QC) Samples

Field QC samples will be identified by adding characters to the end of the sample interval field. The following characters are associated with the following field QC sample types:

- TB – VOC trip blank
- DUP – duplicate sample

8.1.4 Examples

Examples of complete sample numbers with descriptions are as follows:

- DP30-080825-020 A field sample collected at station DP30 on August 25, 2008, from 2 to 2.5 feet bgs.
- MW04-080825-W A groundwater sample collected at monitoring well MW04 on August 25, 2008.

Under the sample designation method described above, the identifier will be unique (that is, no two samples will have the same identifier) and informative (that is, location, date and sample interval). This designation scheme will facilitate overall data management and submittal into Ecology's Environmental Information Management (EIM) database.

8.2 SAMPLE LABELING

Sample information will be printed legibly onto the sample labels in indelible ink. Field identification will be sufficient to enable cross-reference with the project logbook.

To minimize handling of sample containers, labels will be completed before sample collection to the extent possible. The label will be filled out completely in the field and attached firmly to the sample container. The sample label will provide the following information:

- GeoEngineers' job number
- Sample designation
- Date of sample collection (month/day/year)
- Time of sample collection (hours: minutes)
- Chemical analyses to be conducted

- Sample preservation, if applicable
- Initials of sampler

8.3 FIELD LOGBOOKS AND DATA FORMS

Field logbooks (or daily logs) and data forms are necessary to document daily activities and observations. Documentation will be sufficient to enable participants to reconstruct events that occurred during the project accurately and objectively at a later time. All entries will be written in ink, dated and signed daily. No pages will be removed from logbooks for any reason. If corrections are necessary, these corrections will be made by drawing a single line through the original entry (so that the original entry is legible) and writing the corrected entry alongside. The correction will be initialed and dated. Corrected errors may require a footnote explaining the correction.

8.4 PHOTOGRAPHS

Documentation of a photograph is crucial to its validity as a representation of an existing situation. The following information will be noted in the field logbook or data forms concerning photographs:

- Date, time and location where photograph was taken
- Photographer
- Description of photograph taken
- Sequential number of the photograph and the film roll number, or sequence in the digital log
- Compass direction

9.0 DECONTAMINATION PROCEDURES

The objectives of decontamination procedures are to minimize the potential for cross-contamination between individual samples, to prevent contamination from leaving the sampling site by way of equipment or personnel and to prevent exposure of field personnel to contaminated materials. This section discusses general decontamination procedures.

9.1 PERSONNEL

Personnel decontamination procedures depend on the level of protection specified for a given activity. The HASP identifies the appropriate level of protection for each type of fieldwork involved in this project, as well as appropriate decontamination procedures.

9.2 SAMPLING EQUIPMENT

Decontamination procedures are designed to remove trace-level contaminants from sampling equipment to prevent cross-contamination of samples. Non-dedicated sampling or measurement equipment, including stainless steel sampling tools, soil sampling equipment and water level measurement instruments, will be decontaminated prior to and after each sampling attempt or measurement by washing with a nonphosphate detergent solution (for example, LiquiNox® and distilled water) and rinsing with distilled water.

10.0 INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW) generated from the subsurface investigations will be contained in 55-gallon steel drums and temporarily stored in a secured location as designated by the Port. The IDW is

anticipated to consist of soil cuttings, decontamination water, monitoring well development and purge water. The IDW will be separated by media (that is, soil and water) and labeled appropriately. Chemical analytical results from soil and groundwater sample analyses may be used to profile IDW for disposal at an appropriate off-site disposal facility. Solid waste from sampling activities (used gloves, tubing, etc.) will be contained in plastic trash bags and disposed as solid waste.

11.0 QUALITY ASSURANCE PROJECT PLAN

11.1 QUALITY ASSURANCE OBJECTIVES

The general quality assurance (QA) objectives for this project are to develop and implement procedures for obtaining and evaluating data of a specified quality that can be used to assess site conditions and risks. Field QA procedures to be followed include completing all appropriate sample documentation. Measurement data should have an appropriate degree of accuracy and reproducibility; samples obtained should be representative of actual field conditions, and samples should be obtained and analyzed using proper chain-of-custody procedures.

11.2 FIELD QA/QC PROCEDURES

Field QA/QC procedures to be followed include completing all appropriate sample documentation and preservation. One trip blank will be placed in each sample shipping container (for example, cooler) and analyzed for VOCs.

11.2.1 Trip Blanks

The analytical results of field trip blanks will be reviewed to evaluate the possibility for contamination resulting from the laboratory-prepared sample containers or the sample transport containers. Trip blanks will be analyzed at a frequency of one for each shipment of samples containing field samples for chemical analysis of VOCs. The trip blanks will be labeled with a "TB" sample identifier as described earlier in the "Sample Designation" section (Section 8.1) and delivered to the laboratory with the normal shipment of samples.

11.2.2 Sample Preservation and Containers

Samples will be kept in a cooler with ice before and during transport to the laboratory. The sampling extraction and analysis dates will be reviewed to confirm that extraction and analyses were completed within the recommended holding times, as specified by EPA protocol. Appropriate laboratory-assigned data qualifiers will be noted if holding times are exceeded or containers do not contain the appropriate sample preservation. Table 6 summarizes sample preservation and containers.

11.3 LABORATORY QA/QC PROCEDURES

The data quality objectives will be met in the laboratory by using established instrument calibration and sample handling procedures, analysis according to standard analytical methods and analysis of quality control samples. Laboratory quality control will consist of analysis of surrogate spikes, method blanks, duplicates, matrix spikes and matrix spike duplicates and reporting of all data including holding times.

11.3.1 Equipment Calibration Procedures and Frequency

All instruments and equipment used by the laboratory will be operated, calibrated and maintained according to manufacturer's guidelines and recommendations. Operation, calibration and maintenance

will be performed by personnel who have been properly trained in these procedures. A routine schedule and record of instrument calibration and maintenance will be kept on file at the laboratory.

11.3.2 Analytical Procedures

Samples will be analyzed according to analytical methods listed in Tables 1, 3, 4 and 5. EPA standard analytical methods are specified in *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW-846* (through update III), dated December 1996. Washington analytical methods for petroleum hydrocarbons are specified in the Model Toxics Control Act (MTCA) regulations, as outlined in Washington Administrative Code (WAC) 173-340.

11.3.3 Laboratory QA/QC Samples

Laboratory QC samples will be analyzed at a frequency of 5 percent (1 in 20) on a laboratory batch basis. Laboratory QC samples will consist of duplicates, method blanks, matrix spikes and matrix spike duplicates. In addition, each organic analysis will include addition of surrogate compounds to the sample for surrogate spike analysis.

11.3.4 Laboratory Deliverables

The following information will be provided in the laboratory reports submitted for this project:

- Transmittal letter, including information about the receipt of samples, the testing methodology performed, any deviations from the required procedures, any problems encountered in the analysis of the samples, any problems meeting the method holding times or laboratory control limits, and any corrective actions taken by the laboratory relative to the quality of the data contained in the report.
- Sample analytical results, including sampling date, date of sample extraction or preparation, date of sample analysis, dilution factors and test method identification; soil sample results in milligrams per kilogram (mg/kg), micrograms per kilogram (µg/kg) or nanograms per kilogram (ng/kg); and detection limits for undetected analytes. Results will be reported for all field samples, including field duplicates and blanks submitted for analysis.
- Method blank results, including reporting limits for undetected analytes.
- Surrogate recovery results and corresponding control limits for samples and method blanks (organic analyses only).
- Matrix spike/matrix spike duplicate and/or blank spike/blank spike duplicate spike concentrations, percent recoveries, relative percent differences and corresponding control limits.
- Laboratory duplicate results for inorganic analyses, including relative percent differences and corresponding control limits.
- Sample chain-of-custody documentation.

The raw analytical data, including calibration curves, instrument calibration data, data calculation work sheets and other laboratory support data for samples from this project, will be compiled and kept on file at the laboratory's office for reference.

11.4 REVIEW OF FIELD AND LABORATORY QA/QC DATA

The sample data, field and laboratory QA/QC results will be evaluated for acceptability with respect to the RI data quality objectives (DQOs). Each group of samples will be compared with the DQOs and

evaluated using data validation guidelines contained in the following documents: *Guidance Document for the Assessment of RCRA Environmental Data Quality*, draft dated 1988 and *National Functional Guidelines for Organic Data Review*, draft 1999. To accomplish data evaluation, the criteria listed in the following subsections will be assessed.

11.5 PRECISION, ACCURACY AND COMPLETENESS

11.5.1 Precision

Precision is a measure of data variability. Variability can be attributed to sampling activities and/or chemical analysis. Relative percent difference (RPD) is used to assess the precision of the sampling and analytical method and is calculated as follows.

RPD = 100[(Xs - Xd)/(Xs + Xd)]/2

where

RPD	=	relative percent difference
Xs	=	sample analytical result
Xd	=	duplicate sample analytical result

11.5.2 Accuracy

Accuracy is a measure of the error between chemical analytical results and the true sample concentrations. Accuracy is a measure of the bias in a system and will be expressed as the percent recovery of spiked samples. The accuracy will be presented as percent recovery and will be calculated as follows.

PR = 100(Xss - Xs)/T

where

PR	=	percent recovery
Xss	=	spike sample analytical result
Xs	=	sample analytical result
T	=	known spike concentration

11.5.3 Completeness

Completeness is evaluated to assess whether a sufficient amount of valid data is obtained. Completeness is described as the ratio of acceptable measurements to the total planned measurements. Completeness is calculated as follows.

C = (Number of samples having acceptable data)/
(total number of samples analyzed) x 100%

where

C	=	completeness

11.6 REPORTING, DOCUMENTATION, DATA REDUCTION AND CORRECTIVE ACTION

Upon receipt of each laboratory data package, data will be evaluated against the criteria outlined in the previous sections. Any deviation from the established criteria will be noted and the data will be qualified, as appropriate. A review and discussion of analytical data QA/QC will be submitted in a report to be attached to the RI report. Data validation procedures for all samples will include checking the following, when appropriate.

1. Holding times
2. Detection limits
3. Field equipment rinseate blanks
4. Laboratory blanks
5. Laboratory matrix spikes
6. Laboratory matrix spike duplicates
7. Laboratory blank spikes
8. Laboratory blank spike duplicates
9. Surrogate recoveries

If significant quality assurance problems are encountered, appropriate corrective action as determined by GeoEngineers' project manager and/or the chemical analytical laboratory will be implemented as appropriate. All corrective action will be defensible, and the corrected data will be qualified.

Spatial information collected during the field event will be analyzed and displayed using ArcGIS 9.1 and EQUIS 3 to manage the chemical analytical data.

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses								Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
				NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]		
1. Additional characterization is needed to define the extent of soil contamination at the site. The aerial and vertical extent of soil contamination needs to be further defined in the vicinity of DP02 and DP04 (including westward beneath Jefferson Street and on adjacent offsite parcels if necessary) and north of DP18.	TPH-D, TPH-MO, arsenic, and cadmium in the 2-6 feet interval were the only COPC exceedances at DP04. These COPCs have been delineated laterally in this interval to the northeast and south with MW08 and DP03, respectively. A new soil boring will be advanced northwest of DP04 to complete the lateral delineation of COPC screening level exceedances in the 2-6 feet interval. Soil samples will also be obtained from beneath existing railroad tracks to be removed during infrastructure construction activities. The railroad tracks are currently embedded in the asphaltic pavement along Jefferson Street and we expect that the section beneath the pavement will consist of railroad ties supporting the rail and ballast material (typically 3 feet of crushed rock) supporting the ties. Soil samples will be collected at the soil/ballast interface. We will analyze soil collected beneath the ballast material for cPAHs (using EPA Method 8270C), TPH, and metals to assess potential residual soil contamination associated with the ties.	DP37	0-2										
			2-6	x [a]	X	X	x		x	X			light sand fill
			6-10	X	X	X	x			X			dark sand fill
	TPH-MO in the 2-6 feet interval was the only significant COPC exceedance at DP02. This COPC has been delineated laterally in this interval to the north and southeast with DP03 and DP16, respectively. A new soil boring will be advanced southwest of DP02 to complete the lateral delineation of the TPH-MO screening level exceedance in the 2-6 feet interval. A sample from 10 to 14 feet from the monitoring well boring for MW25S will be tested for TPH-MO to evaluate the vertical extent of this COPC identified in previous samples from DP02. Proposed shallow screen interval for MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04. Soil samples from below the railroad tracks will also be collected and analyzed from DP38 and analyzed for PAHs. PAHs will be tested in sample from 10 to 14 foot depth interval in the boring for MW25S to evaluate the vertical extent of this COPC identified previously at DP02 and DP16. One sample from DP38 will be tested for dioxins/furans to evaluate soil within the infrastructure corridor.	DP38	1-3				x		x				
			4-6	x	X	X	x	x	x		x		light sand fill
			6-10	X	X	X	x	x	x		x	9	Silt or dark sand fill
		MW25S	0-2										
			2-6										
			6-10	x	X	X	X		X				Silt or dark sand fill
			10-14	x	X	X	X		x				Silt or dark sand fill
	TPH-MO in the 10-14 feet interval was the only significant potential COPC exceedance at DP18. This COPC has been delineated latreally in the vadose zone and saturated zone with MW03, MW16, and DP17 but has not been delineated laterally north of DP18. Soil samples from the boring for MW23S will provide this information. Proposed screen interval for MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18. TPH-MO will be tested in MW-23S at the 6 to 10 and 10 to 14 foot intervals to evaluate the vertical extent of TPH-MO identified previously at DP18.	MW23S	0-2										
			2-6										
			6-10	x [a]	X	X	X		X				light sand fill
			10-14	x	X	X	X		X				light sand fill
2. Additional characterization is needed to define the extent of soil contamination at the site. The vertical extent of contamination needs to be defined in the vicinity of DP06 and DP08.	TPH-G in the 2-6 feet interval was the only significant potential COPC exceedance at DP06 and needs to be defined at depth and to the south. TPH-D and TPH-MO in the 2-6 feet interval were the only significant potential COPC exceedances at DP08. TPH-D and TPH-MO exceedance was identified in the 2-6 feet interval in DP-13. The vertical extent of gasoline, diesel and oil contaminated soil has been delineated with DP24, DP15, DP14, MW-5, MW-8 and MW-10. MW24S, along with the other proposed and existing wells, will be used to evaluate the leaching to groundwater pathway via empirical demonstration per WAC 173-340-747(9) an (10)(c). Proposed shallow screen interval for MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	MW24S	4-6	X	X	X	X		X				
			6-10	X	X	X	X		X				
	Evaluate lateral extent of TPH-D and MO identified previously at DP08 and DP13. Evaluate lateral extent of gasoline exceedance at DP08 and DP13.	DP39	0-2	X	X	X	X		X				
			2-6	x [a]	X	X	X		X				dark sand fill
	Lateral and vertical extent of dioxins/furans by TP03. Evaluate thickness of pre-1891 fill. Collect data to support management of soil that will be excavated as part of the infrastructure improvements. DP40 will also help evaluate the extent of diesel and oil contamination previously observed in DP13 and DP08 at 2-6 feet.	DP40	0-2	x	X	X	x	x	x				light sand fill
			2-4	x	X	X	x	x	x		x		light sand fill
			4-6	x	X	X	x	x	x		x	3.5	dark sand fill
3. Additional characterization is needed to define the extent of soil contamination at the site. The aerial extent of contamination has not been defined in the vicinity of MW19.	TPH-G in the 2-6 feet interval was the only potential COPC exceedance at MW19. Two soil borings (DP28 and the boring for MW21s) will be located near MW19 to evaluate the aerial extent of the screening level exceedance of TPH-G at MW19 in the 2-6 feet interval. The proposed screen interval (2 to 7 feet bgs) for MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19. Moreover, a soil boring advanced to the west of MW19 in response to Ecology Comment #7 (i.e. DP27) will also be sampled for TPH-G in the 2-6 feet interval to provide lateral delineation to the west. To address Ecology comment 7, if evidence of burned wood or ash is observed in boring DP28, which is located on the northern edge of parcel 1 near the former Refuse Fire Area, a sample of this material will be analyzed for dioxins and furans.	DP28	0-2	X	X	X	X						
			2-6	X	x	X	X						light sand fill
		MW21S	0-2										
			2-6		x [a]								light sand fill

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
4. Additional characterization is needed to define the extent of soil contamination at the site. Area of Concern (AOC) #16 (pad mounted transformer) needs to be evaluated. Soil samples should be collected from this area for petroleum hydrocarbons and PCBs. The location of well MW04 does not appear to be close enough to this AOC to be adequate.	One new boring will be advanced and sampled within AOC 16 as recommended by Ecology. The targeted depth for the soil sample collected from this boring is the elevation of the former transformer pad located in AOC 16. The sample from this boring will be analyzed for PCBs and mineral oil range petroleum hydrocarbons (NWTPH-Dx).	DP35	0-2										
			2-6	x						x			gravel fill
5. Parcel 1 needs to be assessed. AOCs #43 through 48 and #50 have not been adequately assessed. Also, the northern portion of Parcel 1 needs to be assessed.	The first sentence of this comment does not apply because the East Bay Redevelopment Project Area only includes the northwest portion of Parcel 1. A new boring (DP36) located in the right-of-way of Olympia avenue adjacent to the northwest portion of Parcel 1will address Ecology's concern regarding the northern portion of Parcel 1. However, the primary purpose of this boring is to evaluate soil conditions to assist in planning of future infrastructure improvements in this area and evaluate residual concentrations of COPCs in an area where historical sources were not located.	DP36	1-3					x					gravel fill
			2-6	x	x	X	x	X					silt
			6-10					X				9	silt
6. Additional characterization of dioxins/furans is needed. As shown in the report, concentration of dioxins/furans that exceed the MTCA Method B Soil Cleanup Level of 11 nanograms per kilogram (ng/kg) or parts per trillion (ppt), expressed as a Total Toxicity Equivalency Factor (TEF), were observed at all four locations tested for this constituent. The reported TEF values from these locations range from 57.9 to 645 ng/kg. Because the highest concentration (TP02) is near the east property line and near an adjacent public walking path and grassy area, additional samples for dioxins/furans should be collected in this adjacent area. Also, an analysis of wind direction should be performed to help predict locations that may show higher dioxin concentrations.	New boring DP33 will provide vertical profile of dioxins/furans concentrations near TP2. Selection of sample locations based on prediction of wind direction is not necessary because the proposed dioxins/furans sample locations (as outlined in this table) provide spatial coverage across the site.	DP33	0-2					x	x	x			gravel fill
			2-4				x	x	x		x		gravel fill
			4-6				x	x	x				light sand fill
			6-8					x				9	light sand fill
7. Additional characterization of dioxins/furans is needed. Parcel 7 is located adjacent to the Refuse Fire Area (Area of Concern #1), which is a potential source of dioxins/furans contamination. Additional soil samples for dioxins/furans analyses should be performed in Parcel 7. These samples will provide additional dioxins/furans data for the site and may help to determine whether AOC #1 was a source.	Additional samples which address Ecology's comment 7 will be collected and tested for dioxins/furans from a boring advanced near AOC 1 (DP27) and a boring advanced at the northern edge of Parcel 7 (DP28). In addition, DP27 will be sampled for TPH-G to address gasoline contamination identified in soil at MW-19 (see response to Ecology Comment #3). Samples from boring DP27 will also be analyzed for PAHs to evaluate the lateral and vertical extent of cPAHs identified in soil samples from MW-20, near the Refuse Fire Area. Note that Parcel 8, which is adjacent to the northwest portion of the Site, is being addressed by LOTT Alliance through Ecology's Voluntary Cleanup Program.	DP27	0-2					x	x	x			light sand fill
			2-4		x	X	x	x	x		x		light sand fill
			4-6				x	x	x		x		silt
			6-8				x	x				3	silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
8. Additional characterization of dioxins/furans is needed. Section 4.3.1 states that "dioxin testing appears to indicate that the historical working surface (depth of about 2 feet below existing grade) is impacted." Please provide more detail on what is meant by "historical working surface" and how it is distinguished. According to the Supplemental Site Use History report, the boiler house (AOC #17) operated circa 1932 and the power house (AOC #22-24) operated from at least 1941 through 1958. Was 2.0 feet below current grade the historical grade for these facilities? If so, what evidence is there for this? Dioxin samples were collected at the 2.0 foot depth at AOC #17, at the 3.5 depth at AOC #22-24, and at the 1.5 and 2.0 foot depths at the two randomly selected locations. It is recommended that additional samples be collected at AOC #17 so that a concentration verses depth profile can be determined.	The "historical working surface" is the sometimes woody and compacted historical grade where industrial buildings were located and operations were conducted on the property prior to later filling and grading. Based on our review of historical information the working surface is located about 1 to 4 feet below existing grade, however it can be difficult to identify in borings due to similarity in lithology of fill in this depth interval. Because of Ecology's questioning of the historical working surface and difficulty in determining its exact location in borings, a more appropriate rationale for the location of explorations where vertical profiles for dioxins/furans testing is as follows:1) complete a profile (DP33) adjacent to previous sample with high dioxins concentrations (TP02) and 2) complete a profile that represents temporal fill sequences.	See DP 33 (Comment 6) and borings and "Additional Explorations" rationale below.										
9. Additional characterization of groundwater contamination, flow direction, and gradient is needed. Groundwater monitoring wells MW-1 through MW·11 and MW-14 were installed with their screened interval submerged below the water table. Wells that monitor for light non-aqueous phase liquids (LNAPL, such as petroleum hydrocarbons) should be completed so that their screen straddles the water table. Therefore, to accurately evaluate whether groundwater is contaminated from LNAPL constituents, it will be necessary to install additional groundwater monitoring wells with screens that extend above the water table at selected locations where the existing monitoring wells are not adequate. Please present your proposed new well locations to us for review and approval.	Given the general lack of dissolved-phase petroleum constituent detections in the groundwater samples collected from existing MWs (as well as the relatively low TPH soil concentrations detected in soil samples collected from areas with suspected hydrocarbon contamination), it is unlikely that the typical placement of the screened intervals straddling the water table would result in measurable LNAPL thicknesses or even a screening level TPH exceedance at any MW at this site. Nonetheless, five shallow MWs (MW21S through MW25S) with screens straddling the water table are proposed to address this comment. MW21S and MW24S are discussed in the responses to Ecology Comments #2 and #3, respectively. Proposed MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06. MW23S and MW25S are discussed in the response to Ecology Comment #1. This Ecology comment is further addressed by in the Groundwater Monitoring Plan. Based on recent comments from Ecology (9/22/08 Ecology comment letter and subsequent discussion), because artesian wells at the Site may be influencing shallow groundwater, an attempt will be made to locate and decommission or otherwise mitigate leakage from the artesian wells. If the artesian wells are found and decommissioned, water levels and the need for shallow monitoring wells will be reevaluated.	MW22S	No analysis of soil samples unless field observations indicate the presence of contamination. Anticipated screened interval is 1-6 feet bgs.									
Additional Explorations													
Additional explorations to evaluate the nature and extent of contamination, including dioxins/furans. These explorations will provide data related to: a) regional area background concentrations of dioxins/furans and metals not related to a site release, b) management of soil that will be excavated as part of the infrastructure improvements, and c) evaluation of COPC distribution in different fill types and spatial coverage related to general extent of COPCs.	Evaluate extent of lead and PAHs at DP11.	DP29	0-2						x				light sand fill
			2-6				x						silt or gravel
			6-10				x						silt or gravel
			10-14						x				silt or gravel
	Evaluate dioxins/furans in fill (1891 to 1908 time interval), evaluate dioxins/furans in soil within the infrastructure corridor, and provide additional sampling data for parcel 9.	DP30	0-2				x	x					light sand fill
			2-4				x	x	x				light sand fill or silt
			6-8				x	x (if silt)				9	light sand fill or silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration	Sampling Depth Interval (ft bgs)[1]	Soil Analyses								Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
		Boring (DP) Well (MW)		NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]		
	Locations DP31 and DP41 are selected to obtain dioxins/furans data from soil not associated with any AOC source. This data will be used to evaluate dioxins/furans concentrations related to regional dioxin sources and regional background levels as it is possible that detected concentrations of dioxins/furans and metals in soil samples collected to date are attributable to an area or regional background rather than a site release. DP31 is located on parcel 6 in an area where no historical sources (AOCs) were located and the underlying fill is from the 1948 to 1975 time period. DP41 is located on parcel 2 in an area where no historical sources (AOCs) were located and the underlying fill is from the post 1975 time period.	DP31	0-2					x					light sand fill
			2-6	x			x	x					light sand fill
		DP41	0-2					x					gravel fill
			2-6				x	x					silt
	Evaluate dioxins/furans in post-1975 fill within the infrastructure corridor. These data will assist with evaluating background conditions as well as inform waste characterization and disposal associated with the excavated infrastructure corridor soils.	DP32	0-2					x			x		gravel fill
			2-6				x	x	x		x		gravel fill
			6-9					x				9	gravel fill
	Evaluate dioxins/furans in fill (1891 to 1908 time interval) near infrastructure corridor and on Parcel 4.	DP34	0-2					x					light sand fill
			2-6	X	X	X	x	x	x		x		light sand fill
			8-10	X	X	X	x	x	x			10	light sand fill or gravel
	These borings are located on Parcel 4 and the locations were selected to gather information to support soil characterization during construction activities associated with the Children's Hands on Museum.	DP26	0-2				X	x	X				light sand fill
			2-6					x	X				silt or light sand fill
			6-10				X	X					
		DP42	0-2				X	x					gravel fill
			2-6				X	x					light sand fill
			6-10				X	X					

Notes:

Blank boxes (no X) indicate that soil samples will be collected from the specified depth intervals and held for potential analyses by the analytical laboratory

Shaded cells indicate explorations and samples that will be collected in first phase of investigation

[1] Samples will be collected approximately every 2 feet in soil borings for field screening and potential chemical analyses. Discrete soil samples will be obtained from within the depth intervals shown in this column (rather than composite samples.) The depth ranges represent the intervals that a sample will be analyzed for the COPCs identified in the Soil Analyses columns. Additional samples may be analyzed if field observations indicate the presence of contamination.

[2] The metals listed; arsenic, cadmium and lead, represent metals that had concentrations exceeding screening levels in one or more locations. Some soil samples collected from the infrastructure corridor may also be analyzed for "RCRA 8" metals to provide data needed by soil disposal facilities. The RCRA metals include arsenic, barium, cadmium, chromium, lead, mercury, selenium & silver.

[3]TOC= total organic carbon. TOC and other physical soil properties such as grain size may also be analyzed at various locations for the possibility of establishing site specific Method B cleanup levels.

[a] Also analyze for EPH.
[b] Also analyze for total organic carbon
x = sample collected for analytical testing. Red X = additional analytical testing requested by Ecology in it's September 22, 2008 comment letter.
As = Arsenic, Cd = Cadmium, Pb = Lead
PCBs = Polychlorinated biphenyls
HCID = Hydrocarbon Identification test (NWTPH-HCID)
NWTPH-Dx = Diesel-range and motor oil-range total petroleum hydrocarbons
TPH-MO = motor oil-range petroleum hydrocarbons
D/F = Dioxins and furans
NWTPH-G = Gasoline-range total petroleum hydrocarbons

PROPOSED NEW MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

				Existing Well Data[2]		
Well I.D.	**Purpose**	**Installation Method/Well Diameter**	**Proposed Well Screen Interval (BGS-feet)[1]**	**Nearest Existing well**	**Highest DTW**	**Lowest DTW**
MW21s	MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19.	Direct push/1-inch	2 to 7	MW19	3.47	3.78
MW22s	MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06.	Direct push/1-inch	1 to 6	MW6	0.84	1.14
MW23s	MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18.	Direct push/1-inch	4 to 9	MW16	5.41	6.35
MW24s	MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	Direct push/1-inch	2.5 to 7.5	MW10	3.48	3.8
MW25s	MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04	Direct push/1-inch	2 to 7	MW7 and MW8	5.0 & 2.55	5 & 2.62

Notes:

Based on recent comments from Ecology, because artesian wells at the Site may be influencing groundwater levels, an attempt will be made to locate and decommission the artesian wells. If the artesian wells are found and decommissioned, the need for shallow monitoring wells will be reevaluated.

[1]Across water table with one foot of screen above predicted high water table elevation and four feet of screen below this elevation, subject to approval by Ecology and issuance of well construction variance.

[2] Based on depth to water measurements collected August 2007 and July 2008 during low and high tides.

bgs=below ground surface

DTW = depth to water in feet as measured from top of well casing. Top of well casings for referenced wells is approximately at ground surface.

Notes:

[1]Dissolved metals to be tested in addition to total metals at locations where metals exceedances have been measured. Also test these samples for aluminum and iron (Al and Fe^{3+}) to represent suspended clay particles. Results to potentially be used for evaluating sorption of COPCs.

[2]MW05, MW12, MW16 and MW18 are downgradient wells between the subject property and East Bay. These wells will be considered for potential future compliance wells.

[3]MW04, 05, 06, 07, 08, 10 were sampled and tested July 13, 2007 for diesel-range hydrocarbons only.

[4]MW01 through MW10 were installed in January 2007. MW11 through MW20 were installed in July and August 2007.

[5]MW14 was not sampled in 2007 because other monitoring wells surrounding MW14 were sampled and tested.

[6]Note on SVOCs. The only SVOC exceedances were cPAHs, therefore only cPAHs will be analyzed, rather than the full SVOC list.

[7]Note on PCBs. PCBs have not been detected in any of the groundwater samples obtained from MW01 through MW20 at the site; nor have they been detected above soil screening levels. Therefore PCBs will only be tested at locations where low level detections of PCBs were detected in soil on Parcel 3 and near the former transformer location (MW04).

[8]Note on Dioxins/Furans. Dioxin/Furans were not detected in a groundwater sample obtained and tested from MW16 in August 2008. Dioxin sampling and testing approach is based on obtaining samples from potential source area wells that are also downgradient compliance wells (MW05 and MW16). If dioxins/furans are detected in groundwater at MW05 or MW16, then additional testing will be conducted at the other compliance wells (MW04, MW11, MW12

[9]This well will not be installed if water levels drop sufficiently after the artesian wells are decommissioned if the existing paired monitoring well screen is not totally submerged.

[10]Water from this seep area will only be sampled if it is determined to represent groundwater (see Section 5.4.2 of Sample and Analysis Plan)

x = sample collected for analytical testing
Y = Yes; N = No; NA = not applicable; "--" = Not tested
TPH-Gasoline by Ecology Method NWTPH-Gx
TPH-Diesel and Oil by Ecology Method NWTPH-Dx
VOCs (volatile organic compounds) by EPA Method 8260B
RCRA Metals (As, Ba, Cd, Cr, Pb, Ag, Se, Hg) by EPA Methods 6000/7000
PAHs (polycyclic aromatic hydrocarbons) by EPA Method 8270sim
PCBs (polychlorinated biphenyls) by EPA Method 8082
Dioxins/Furans by EPA Method 1613B
ORP = Oxidation Reduction Potential
DO = Dissolved Oxygen
Fe = Iron
Al = Aluminum
COPCs = contaminants of potential concern

TABLE 4
SOIL ANALYTICAL TARGET REPORTING LIMITS
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Analytes	Units	Analytical Laboratory Criteria[1]	
		Target Reporting Limits	Analytical Method
Total Petroleum Hydrocarbons			
Gasoline-Range	mg/kg	5.0E+00	NW-TPH-Gx
Diesel-Range	mg/kg	5.0E+00	NW-TPH-Dx
Oil-Range (including Mineral O	mg/kg	1.0E+01	NW-TPH-Dx
Metals			
Arsenic	mg/kg	5.0E+00	6010B ICP
Cadmium	mg/kg	2.0E-01	6010B ICP
Lead	mg/kg	2.0E+00	6010B ICP
Volatile Organic Compounds[2]			
BTEX	mg/kg	1.0E-03	EPA 8260B
Semivolatile Organic Compounds[2]			
SVOCs	mg/kg	6.7E-02	EPA 8270
4-Chloro-3-methylphenol	mg/kg	3.3E-01	EPA 8270
Polycyclic Aromatic Hydrocarbons[2]			
PAHs	mg/kg	5.0E-03	EPA 8270D SIM
Polychlorinated Biphenyls[2]			
Total PCBs	mg/kg	4.0E-03	8082 Low Level
Dioxins and Furans			
2,3,7,8-TCDD	mg/kg	5.0E-07	1613/8290
2,3,7,8-TCDF	mg/kg	5.0E-07	1613/8290
-Penta, Hexa, Hepta	mg/kg	2.0E-06	1613/8290
-Octa	mg/kg	5.0E-06	1613/8290

Notes:

[1] These limits represent target reporting limits typically achievable by analytical laboratories. However, there may be instances where these levels cannot be achieved due to sample specific interferences.

[2] Reporting limits for VOCs, SVOCs, PAHs, and PCBs are indicated for the group of compounds. Specific compounds are listed separately if they have a different reporting limit.

mg/kg = milligrams per kilogram
SVOCs = Semivolatile Organic Compounds
TCDD = Tetrachlorinated Dibenzo-p-dioxins
TCDF = Tetrachlorinated Dibenzofurans
PCBs =Polychlorinated Biphenyls
BTEX = benzene, toluene, ethylbenzene, and xylenes
PAHs = Polycyclic Aromatic Hydrocarbons

APPENDIX E
HEALTH AND SAFETY PLAN

GEOENGINEERS, INC.
SITE HEALTH AND SAFETY PLAN CHECKLIST
PORT OF OLYMPIA EAST BAY REDEVELOPMENT
PORT OF OLYMPIA - 0615-034-07

This checklist is to be used in conjunction with the GeoEngineers' Safety program manual. Together, the program and this checklist comprise the site safety plan for this project. This plan is to be used by GeoEngineers personnel on this site. If the work entails potential exposures to other substances or unusual situations, additional safety and health information will be included and the plan will be approved by the GeoEngineers Health and Safety Manager. All plans are to be used in conjunction with current standards and policies outlined in the GeoEngineers Health and Safety Program Manual.

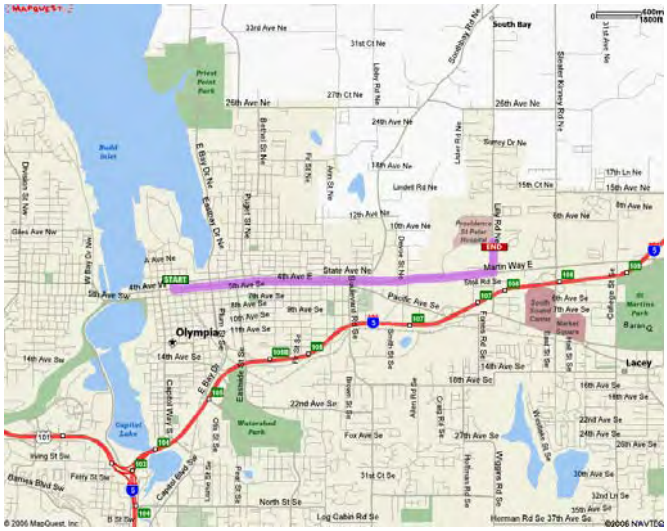
1. GENERAL PROJECT INFORMATION

Project Name:	Port of Olympia East Bay Redevelopment
Project Number:	0615-034-07
Type of Project:	Drilling oversight, soil and groundwater sampling
Start/Completion:	TBD (start date estimated Fall 2008)
Contractors:	TBD

Liability Clause - This Site Safety Plan is intended for use by GeoEngineers Employees only. It does not extend to the other contractors or subcontractors working on this site. If requested by subcontractors, this site safety plan may be used as a minimum guideline for those entities to develop safety plans or procedures for their own staff to work under. In this case, Form C-3 shall be signed by the subcontractor.

2. SCOPE OF WORK

The scope of work identified in this HASP is associated with remedial excavation, soil stockpiling and soil sampling.



3. PERSONNEL/CONTACT INFORMATION PHONE NUMBERS

Title	Name	Telephone Numbers
Site Safety and Health Supervisor	GeoEngineers Field Staff	TBD
Project Manager	Jay Lucas	206-239-3221
Health and Safety Program Manager	Leah Alcyon, CIH	425-861-6098
Field Engineer/Geologist	GeoEngineers Field Staff	TBD
Client	Port of Olympia – Joanne Snarski	360-528-8020
Site Contact	Port of Olympia – Al Kulp	360-528-8006

Site safety and health supervisor -- The individual present at a hazardous waste site responsible to the employer and has the authority and knowledge necessary to establish the site-specific health and safety plan and verify compliance with applicable safety and health requirements.

4. EMERGENCY INFORMATION

Providence St. Peter Hospital
413 Lilly Road NE
Olympia, Washington 98506-5166
(360) 491-9480

Hospital Name and Address:	Providence St. Peter Hospital 413 Lilly Road NE Olympia, WA 98506-5166
Phone Numbers (Hospital):	(360) 491-9480
Starting from:	Corner of Jefferson St NE and State Ave NE Olympia, WA
Arriving at:	413 Lilly Road NE Olympia, WA
Distance:	3 miles
	1. Head west from State Ave NE - go 73 ft 2. Turn left at Franklin St NE - go 0.1 mi 3. Turn left at 4th Ave E - go 1.6 mi 4. Continue on Martin Way E - go 1.0 mi 5. Turn left at Lilly Rd NE - go 0.3 mi
Ambulance:	9-1-1
Poison Control:	9-1-1
Police:	9-1-1
Fire:	9-1-1
Location of Nearest Telephone:	Cell phones are carried by field personnel.
Nearest Fire Extinguisher:	Located in the GEI vehicle on site.
Nearest First-Aid Kit:	Located in the GEI vehicle on site.

4.1 Standard Emergency Procedures

1. Get help -
   - send another worker to phone 911 (if necessary)
   - as soon as feasible, notify GeoEngineers' project manager
2. Reduce risk to injured person -
   - turn off equipment
3. Get help -
   - send another worker to phone 911 (if necessary)
   - as soon as feasible, notify GeoEngineers' project manager

4. Reduce risk to injured person -
   - turn off equipment
   - move from injury location (if possible)
   - keep warm
   - perform CPR (if necessary)
5. Transport injured person to medical treatment facility (if necessary) -
   - by ambulance (if necessary) or GeoEngineers vehicle
   - stay with person at medical facility
   - keep GeoEngineers manager apprised of situation and notify human resources manager of situation

5. PERSONNEL TRAINING RECORDS

Name of Employees	Level of Training (24/ 40 hr)	Date of Last Training	HAZWOPER Supervisor Training	First Aid/ CPR	Respirator Fit Test

6. KNOWN (OR ANTICIPATED) HAZARDS

Note: A hazard assessment will be completed at every site prior to beginning field activities. Updates will be included in the daily log. This list is a summary of hazards listed on the form.

6.1 Physical Hazards

X	Drill rigs and concrete coring/slab cutting
	Backhoe
	Trackhoe
	Crane
	Front End Loader
	Excavations/trenching (1:1 slopes for Type B soil)
	Shored/braced excavation if greater than 4 feet of depth
X	Overhead hazards/power lines
X	Tripping/puncture hazards
X	Unusual traffic hazard – Street traffic

6.2 Physical Hazard Mitigation Measures or Procedures

- Work areas will be marked with reflective cones, barricades and/or caution tape. Personnel will wear blaze orange vests for increased visibility by vehicle and equipment operators.

- Field personnel will be aware constantly of the location and motion of heavy equipment. A safe distance will be maintained between personnel and the equipment. Personnel will be visible to the operator at all times and will remain out of the swing and/or direction of the equipment apparatus. Personnel will approach operating heavy equipment only when they are certain the operator has indicated it is safe to do so.
- Heavy equipment and/or vehicles used on this site will not work within 20 feet of overhead utility lines without first ensuring that the lines are not energized. This distance may be reduced to 10 feet depending on the client and the use of a safety watch.
- Personnel entry into unshored or unsloped excavations deeper than four feet is not allowed. Any trenching and shoring requirements will follow guidelines established in WAC 296-155, the Washington State Construction standards or OSHA 1926.651 Excavation Requirements. In the event that a worker is required to enter an excavation deeper than 4 feet, a trench box or other acceptable shoring will be employed or the side walls of the excavation will be sloped according to the soil type and guidelines as outlined in OSHA/WISHA regulations. If the shoring/sloping deviates from that outlined in the WAC, it will be designed and stamped by a PE. Prior to entry, personnel will conduct air monitoring as described later in this plan. All hazardous encumbrances and excavated material will be stockpiled at least two feet from the edge of a trench or open pit. If concentrations of volatile gases accumulate within an open trench or excavation, the means of entering shall adhere to confined space entry and air monitoring procedures outlined under the air monitoring recommendations in this plan and the GeoEngineers Safety Program Manual.
- Personnel will avoid tripping hazards, steep slopes, pit and other hazardous encumbrances. If it becomes necessary to work within 6 feet of the edge of a pit, slope, pier or other potentially hazardous area, appropriate fall protection measures will be implemented by the Site Safety Officer (SSO) in accordance with OSHA/WISHA regulations and the GeoEngineers Safety Program manual.

Engineering Controls:

_____ Trench shoring (1:1 slope for Type B Soils)

_____ Location work spaces upwind/wind direction monitoring

_____ Other soil covers (as needed)

_____ Other (specify)_____

_____

6.3 Chemical Hazards (potentially present at site)

Petroleum Hydrocarbons:

X Naphthalenes or paraffins

X Aromatic hydrocarbons (benzene, ethylbenzene, toluene, xylenes)

X Gasoline

X Diesel fuel

_____ Waste oil

X Other petroleum fuels (list) lube oil-range hydrocarbons

6.4 Hazards from Other Organic Compounds (present or potentially present at site)

X	Chlorinated hydrocarbons (Polychlorinated biphenyls) and PCE. Breakdown products of PCE have not been detected at the site.
X	Polycyclic aromatic hydrocarbons (PAHs)
	Pesticides/Herbicides
X	Other Dioxins/Furans

6.5 Metals (Potentially present at site)

X	Lead
X	Copper
X	Chromium
X	Zinc
X	Other metals (See known chemical characteristics in Site History)

Known chemical characteristics (maximum/ average concentrations for routine monitoring):	Soil Chemistry (mg/kg)	Water Chemistry (µg/l)
Diesel / Oil	21,000	500
Gasoline	290	ND
Dioxins/Furans	645 ng/kg	ND
Lead	2,500	ND
Arsenic	84	140
Cadmium	3.7	ND
PAHs (TEQ)	1.01	ND
PCBs	ND	ND

Summary of Petroleum Hazards

Compound/ Description	Exposure Limits/IDLHb	Exposure Routes	Toxic Characteristics
Diesel Fuel—liquid with a characteristic odor	None established by OSHA, but ACGIH has adopted 100 mg/m3 for a TWA (as total hydrocarbons)	Ingestion, inhalation, skin absorption, and skin and eye contact	Irritated eyes, skin, and mucus membrane; fatigue; blurred vision; dizziness; slurred speech; confusion; convulsions; and headache, and dermatitis
Gasoline (Unleaded)—clear liquid with a characteristic odor	PEL 300 ppm TLV 300 ppm STEL 500 ppm	Ingestion, inhalation, skin absorption, skin and eye contact	Irritated eyes, skin, and mucus membrane; fatigue; blurred vision; dizziness; slurred speech; confusion; convulsions; and headache, and dermatitis

Compound/ Description	Exposure Limits/IDLHb	Exposure Routes	Toxic Characteristics
Mineral Oil – As a mist	The current OSHA PEL for mineral oil mist is 5 mg/m3 of air as an 8-hr TWA	If the oil is not a mist, then route of exposure is skin and eye contact	Exposure to oil mists can cause eye, skin, and upper respiratory tract irritation
Mineral based crankcase oil – may contain metals, gas, antifreeze and PAHs	It depends on the contaminants	Ingestion, inhalation, skin absorption, skin and eye contact	It depends on the contaminants.

Notes:
IDLH = immediately dangerous to life or health
OSHA = Occupational Safety and Health Administration
mg/m^3 = milligrams per cubic meter
TWA = time-weighted average
PEL = permissible exposure limit
TLV = threshold limit value
STEL = short-term exposure limit
ppm = parts per million

6.6 Chemical Hazard Mitigation Measures or Procedures

Air monitoring will be conducted for flammable vapors and for establishing the level of respiratory protection.

- Half-face combination organic vapor/high efficiency particulate air (HEPA) or P100 cartridge respirators will be available on-site to be used as necessary. P100 cartridges are only to be used if PID measurements are below the site action limit. P100 cartridges are used for protection against dust, metals and asbestos, while the combination organic vapor/HEPA cartridges are protective against both dust and vapor. Ensure that the PID or TLV will detect the chemicals of concern on-site.
- Level D PPE will be worn at all times on-site. Potentially exposed personnel will wash gloves, hands, face, and other pertinent items to prevent hand-to-mouth contact. This will be done prior to hand-to- mouth activities including eating, smoking, etc.
- Adequate personnel and equipment decontamination will be used to decrease potential ingestion and inhalation.
- Individual PELs or action limits are not expected to be exceeded given the planned activities. If there are waste oil contaminants in the soil and conditions are damp, airborne dust is not likely to be an issue. If conditions are dry and dust is visible during site activities, personnel will use P100 cartridges on their respirator.

6.7 Biologic Hazards

_____	Poison Ivy or other vegetation	_____
_____	Insects or snakes	_____
_____	Used hypodermic needs or other infectious	**Do not pick up or contact**
_____	hazards	_____
_____	Others	_____

6.8 Biologic Hazard Mitigation Measures or Procedures

Site personnel shall avoid contact with or exposures to potential biological hazards encountered.

Additional Hazards _____

6.9 Additional Hazards (Update in Daily Log)

Include evaluation of:

- Physical Hazards (excavations and shoring, equipment, traffic, tripping, heat stress, cold stress and others)
- Chemical Hazards (odors, spills, free product, airborne particulates and others present)
- Biologic Hazards (snakes, spiders, other animals, discarded needles, poison ivy and others present)

7. LIST OF FIELD ACTIVITIES

Check the activities to be completed during the project

____	Site reconnaissance
X	Exploratory borings
____	Construction monitoring
____	Surveying
____	Test pit exploration
X	Monitoring well installation
X	Monitoring well development
X	Soil sample collection
X	Field screening of soil samples
X	Vapor measurements
X	Groundwater sampling
X	Groundwater depth and free product measurement
____	Product sample collection
____	Soil stockpile testing
____	Remedial excavation
____	Underground storage tank removal monitoring
____	Remediation system monitoring
____	Recovery of free product

8. SITE DESCRIPTION (ATTACH ANY ADDITIONAL SITE PLAN DETAILS AND CHEMICAL ANALYSES)

8.1 Site History

Address/Location: Corner of Jefferson Street NE and State Avenue NE Olympia, Washington

Site topography: Flat

Predominant wind direction: South to north

Site drainage:

- X Municipal drain
- X Surface water drainage
- X Engineered site drains
- ___ Other

Utility check complete: To be completed prior to drilling – see documentation Utility Checklist

Traffic or vehicle access control plans: NA

Site access control (exclusion zone) defined by:

- X Fence
- ___ Survey tape
- X Traffic cones
- X Other (traffic control barriers as required by the city)

Hot zone/exclusion zone (Define): ***Within 10 feet of borings***

Fence around site perimeter, if existing and available otherwise use flagging and/or cones.

N/A

Contamination reduction zone (Define): ***Decontamination will be set up and area will be delineated***

Fence around site perimeter, if existing and available otherwise use flagging and/or cones.

N/A

8.2 Personal Protective Equipment

8.2.1 Personal Protective Equipment (PPE)

Minimum level of protective equipment for these sites is Level D. After the initial and/or daily hazard assessment has been completed, select the appropriate protective gear (PPE) to preserve worker safety. Task-specific levels of PPE shall be reviewed with field personnel during the pre-work briefing conducted prior to the start of site operations.

Check applicable personal protection gear to be used:

- X Hardhat (if overhead hazards, or client requests)
- X Steel-toed boots (if crushing hazards are a potential or if client requests)
- X Safety glasses (if dust, particles, or other hazards are present or client requests)
- X Hearing protection (if it is difficult to carry on a conversation 3 feet away)
- X Rubber steel-toed boots (if wet conditions)

Gloves (specify):

X	Nitrile
	Latex
	Liners
	Leather
	Other (specify) _____

Protective clothing:

	Tyvek (if dry conditions are encountered, Tyvek is sufficient)
	Saranex (personnel shall use Saranex if liquids are handled or splash may be an issue)
X	Cotton
X	Rain gear (as needed)
X	Layered warm clothing (as needed)

Inhalation hazard protection:

X	Level D
	Level C (respirators with organic vapor filters/ P100 filters)

8.2.2 Limitations of Protective Clothing

PPE clothing ensembles designated for use during site activities shall be selected to provide protection against known or anticipated hazards. However, no protective garment, glove or boot is entirely chemical-resistant, nor does any PPE provide protection against all types of hazards. To obtain optimum performance from PPE, site personnel shall be trained in the proper use and inspection of PPE. This training shall include the following:

- Inspect PPE before and during use for imperfect seams, non-uniform coatings, tears, poorly functioning closures, or other defects. If the integrity of the PPE is compromised in any manner, proceed to the contamination reduction zone and replace the PPE.
- Inspect PPE during use for visible signs of chemical permeation such as swelling, discoloration, stiffness, brittleness, cracks, tears, or other signs of punctures. If the integrity of the PPE is comprised in any manner, proceed to the contamination reduction zone and replace the PPE.
- Disposable PPE should not be reused after breaks unless it has been properly decontaminated.

8.3 Respirator Selection, Use and Maintenance

GeoEngineers has developed a written respiratory protection program in compliance with OSHA requirements contained in 29 CFR 1910.134. Site personnel shall be trained on the proper use, maintenance and limitations of respirators. Site personnel that are required to wear respiratory protection shall be medically qualified to wear respiratory protection in accordance with 29 CFR 1910.134. Site personnel that will use a tight-fitting respirator must have passed a qualitative or quantitative fit test conducted in accordance with an OSHA-accepted fit test protocol. Fit testing must be repeated annually or whenever a new type of respirator is used.

8.3.1 Respirator Cartridges

If site personnel are required to wear air-purifying respirators, the appropriate cartridges shall be selected to protect personnel from known or anticipated site contaminants. The respirator/cartridge combination shall be certified and approved by NIOSH. A cartridge change out schedule shall be developed based on known site contaminants, anticipated contaminant concentrations and data supplied by the cartridge manufacturer related to the absorption capacity of the cartridge for specific contaminants. Site personnel shall be made aware of the cartridge change out schedule prior to the initiation of site activities. Site personnel shall also be instructed to change respirator cartridges if they detect increased resistance during inhalation or detect vapor breakthrough by smell, taste or feel although breakthrough is not an acceptable method of determining the change out schedule. At a minimum, cartridges should be changed a minimum of once daily.

8.3.2 Respirator Inspection and Cleaning

The SSO shall periodically (that is, weekly) inspect respirators at the project site. Site personnel shall inspect respirators prior to each use in accordance with the manufacturer's instructions. In addition, site personnel wearing a tight-fitting respirator shall perform a positive and negative pressure user seal check each time the respirator is donned to ensure proper fit and function. User seal checks shall be performed in accordance with the GeoEngineers respiratory protection program or the respirator manufacturer's instructions.

Respirators shall be hygienically cleaned as often as necessary to maintain the equipment in a sanitary condition. At a minimum, respirators shall be cleaned at the end of each work shift. Respirator cleaning procedures shall include an initial soap/water cleaning, a water rinse, a sanitizing soaking and a final water rinse. One capful of bleach per one gallon of water can be used to create the sanitizing soak solution. When not in use, respirators shall be stored to protect against damage, hazardous chemicals, sunlight, dust, excessive temperatures and excessive moisture. In addition, respirators shall be stored to prevent deformation of the face piece and exhalation valve.

8.3.3 Facial Hair and Corrective Lenses

Site personnel with facial hair that interferes with the sealing surface of a respirator shall not be permitted to wear respiratory protection or work in areas where respiratory protection is required. Normal eyeglasses can not be worn under full-face respirators because the temple bars interfere with the sealing surface of the respirator. Site personnel requiring corrective lenses will be provided with spectacle inserts designed for use with full-face respirators. Contact lenses should not be worn with respiratory protection.

9. AIR MONITORING PLAN

Work upwind if at all possible.

Check instrumentation to be used:

_____ TLV Monitor (flammability only, for methane and petroleum vapors)

__X__ Photoionization Detector (PID)

_____ Other (i.e., detector tubes): _____

Check monitoring frequency/locations: and type (specify: work space, borehole, breathing zone):

_____ **15 minutes - Continuous during soil disturbance activities or handling samples**

_____ 15 minutes

_____ 30 minutes

__X__ Hourly (in breathing zone during each excavation, drilling, sampling)

Additional personal air monitoring for specific chemical exposure:

9.1 Action Levels

- The workspace will be monitored using a PID. These instruments must be properly maintained, calibrated and charged (refer to the instrument manuals for details). Zero this meter in the same relative humidity as the area it will be used in and allow at least a 10-minute warm-up prior to zeroing. Do not zero in a contaminated area. The PID can be tuned to read chemicals specifically if there are not multiple contaminants on-site. Can tune to detect one chemical with response factor entered into equipment but PID picks up all Volatile Organic Compounds present. Ionization potential (IP) of chemical has to be less than lamp (11.7/ 10.6eV) and PID does not detect methane. The ppm readout on the instrument is relative to the IP of isobutylene (calibration gas) so conversion must be made in order to estimate ppm of chemical on site.
- An initial vapor measurement survey of the site should be conducted to detect "hot spots" if contaminated soil is exposed at the surface. Vapor measurement surveys of the workspace should be conducted at least hourly or more often if persistent petroleum-related odors are detected. Additionally, if vapor concentrations exceed 5 ppm above background continuously for a five-minute period as measured in the breathing zone, upgrade to Level C PPE or move to a non-contaminated area.
- If the workspace will be monitored using a TLV Sniffer, the TLV Sniffer is not consistently reliable in measuring vapor concentrations less than 400 ppm. Therefore the TLV Sniffer should be used only as a warning indicator of high vapor concentrations. A PID is the preferred instrument and will be used if work with gasoline-contaminated soil is conducted.
- If the TLV Sniffer indicates greater than 1,000 ppm at the borehole or 600 ppm in the breathing zone, flammability may be a problem as well as indicating a health hazard. Stop work, move to an uncontaminated area and stabilize the situation. Continue work with caution, monitoring every 15 minutes.
- Standard industrial hygiene/safety procedure is to require that action be taken to reduce worker exposure to organic vapors when vapor concentrations exceed ½ the TLV. Because of the variety of chemicals, the PID will not indicate exposure to a specific PEL and is therefore not a preferred tool for determining worker exposure to chemicals. If odors are detected then employees will upgrade to respirator with Organic Vapor cartridges and will contact the Health and Safety Program Manager for other sampling options.

10. DECONTAMINATION PROCEDURES

Decontamination consists of removing outer protective Tyvek clothing and washing soiled boots and gloves using bucket and brush provided on site in the contamination reduction zone. Inner gloves will then be removed and respirator, hands and face will be washed in either a portable wash station or a bathroom facility in the support zone. Employees will perform decontamination procedures and wash prior to eating, drinking or leaving the site.

Specify other site-specific decontamination procedures:

11. WASTE DISPOSAL OR STORAGE

PPE disposal (specify): Investigative-derived waste (soil cuttings and purge/decon water) to be stored on-site pending characterization and disposal, as necessary.

IDW disposal or storage:

X On-site, pending analysis and further action, as necessary (e.g. stockpiles)

X Secured in steel drums

X Other (describe destination, responsible parties): Trash bags for solid waste

12. DOCUMENTATION EXPECTED TO BE COMPLETED

NOTE: The Field Log is to contain the following information:

- Updates on hazard assessments, field decisions, conversations with subs, client or other parties.
- Air monitoring/calibration results; personnel, locations monitored, activity at the time of monitoring.
- Action level for upgrading PPE and rationale.
- Meteorological conditions (temperature, wind direction, speed, humidity, etc.).

Required forms:

- Field Log.
- Health and Safety Plan acknowledgment by GeoEngineers employees (Form C-2).
- Contractors Health and Safety Plan Disclaimer (Form C-3).

Conditional forms available at GeoEngineers office:

- Accident Report (Form C-4).

Subject: *Data Gap Investigation Work Plan and Schedule*
East Bay Redevelopment Site, Olympia, Washington

Dear Mr. Teel:

On behalf of the Port of Olympia, I am enclosing for your review two copies of a work plan for the additional data gap soil sampling and analysis at the Port of Olympia East Bay Redevelopment Site (Site). The primary purpose of these proposed data gap samples is to provide additional data to supplement the Site Boundary Technical Memorandum (PIONEER 2010, Ecology 2010) and assist in defining the Site boundary.

Introduction

The Site is located in Olympia, Washington, on the southeast corner of the Port peninsula adjacent to the East Bay of Budd Inlet. Most of the Site consists of fill dredged from Budd Inlet except for what was added after 1979, which was clean fill from an off-site location. The 1979 shoreline is shown on Figures 1 and 2.

The Port of Olympia originally entered the Site into Washington State Department of Ecology's (Ecology) Voluntary Cleanup Program in 2007, and since has entered into Agreed Order (AO) DE5471 and AO DE7830, which superseded AO DE5471. This Work Plan satisfies the Data Gap Investigation Work Plan and Schedule deliverable following the draft Site Boundary Technical Memorandum deliverable specified in AO DE7830.

Description of Soil Sampling and Analysis

Based on existing data, new sample locations are proposed to further characterize the Site and define the Site boundary (see Table 1). In summary, direct-push soil borings will be advanced in eleven locations, seven of those locations will be sampled for carcinogenic polycyclic aromatic hydrocarbons (cPAHs) and eight of those locations will be sampled for chlorinated dibenzo-p-dioxins and chlorinated dibenzofurans (dioxins/furans). Sample locations for cPAHs and dioxins/furans are shown on Figures 1 and 2, respectively. In addition, a limited excavation will be performed in the southwest corner of the Site in Parcel 3 in attempt to remove the P-1 anomaly and any associated impacted soil. The location of the anomaly is shown on Figure 1.

Field guidelines and descriptions of procedures applicable to this Work Plan are outlined in the Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP) provided as Attachment 1. The

SAP/QAPP is Appendix D of the Remedial Investigation Work Plan for the East Bay Redevelopment Site (GeoEngineers and PIONEER 2008). Deviations from this SAP/QAPP are described in Table 2. Field activities will be documented using PIONEER field forms provided as Attachment 2.

All samples will be analyzed by an Ecology accredited laboratory. The analytical methods will be United States Environmental Protection Agency (USEPA) Method SW846-8290 for dioxins/furans, USEPA Method SW846-8270 for PAHs, Ecology Method NWTPH-Dx for diesel- and heavy oil-range petroleum hydrocarbons, and USEPA Method SW846-8082 for polychlorinated biphenyls (PCBs). It is anticipated that Pace Analytical Services will perform the dioxins/furans analyses and Anatek Labs, Inc will perform the rest of the analyses (both laboratories are Ecology accredited for the analyses being performed). Current target soil reporting limits for these analyses are presented in Table 3. As shown in Table 3, all target reporting limits are less than soil screening levels for the Site.

Schedule

Following review and approval of this Work Plan by Ecology, PIONEER will implement the investigation activities described herein. A proposed schedule of upcoming work and deliverables is presented in Figure 3.

If you have any questions or require further information, please do not hesitate to contact me at 570-1700 or Alex Smith at 528-8020.

Respectfully,

Troy Bussey Jr., P.E. (WA, CA), L.G. (WA), L.HG. (WA)
Senior Professional Engineer

TABLES

PIONEER TECHNOLOGIES CORPORATION

Table 1. Proposed Data Gap Soil Sampling Locations

Ecology Comment #[1]	Location Description[2]	Type of Data Gap[3]	Proposed Sampling Location	Analytes	Rationale for Sample Depth Selection[4]
1a	North of MW21S (0.5-1.5)	SB	DP46	cPAHs	Three or four soil samples will be collected from this boring. The intent is to collect one sample from each major soil lithology that is encountered (e.g., pre-1982 fill, soil containing fine-grained wood debris, former native sediments) and to bias depth interval selections towards intervals most likely to be impacted. Considerations in interval selection will include (1) lithology, (2) depth(s) of surrounding exceedances, (3) depth(s) of any debris encountered, and (4) desire to collect one sample near 2 feet bgs.
1a	East of MW21S (0.5-1.5)	SB	DP47	cPAHs	Same depths as 1a for DP46.
1b	West of DP37 (2-3.5)	SB	DP48	cPAHs[5]	Same depths as 1a for DP46.
1b	West of DP38 (5-6)	SB	DP49	cPAHs	Same depths as 1a for DP46.
1c	Northeast of MW05 (10-12)	SB	DP50	cPAHs[5]	If the bottom of the 1982 fill is encountered within 15 feet bgs, one soil sample will be collected from soil beneath the 1982 fill.
1d	East of DP33 (3-4, 7-8)	SB	DP51	cPAHs[5]	Same depth as 1c for DP50.
1e	East of MW04 (2-4)	SB	DP52	cPAHs[5]	Same depths as 1a for DP46.
1f	Northeast of MW20 (6-8)	SB	DP46	cPAHs	Same depths as 1a for DP46.
1f	Northwest of MW20 (6-8)	No sample proposed[6]			
2a	North of DP30 (7-7.5)	SB	DP53[(7)]	D/F	Pre-1982 fill was encountered from ground surface to 7 feet bgs in DP30 and neither of the two DP30 samples collected from pre-1982 fill had a D/F exceedance. Similarly there are no D/F exceedances in the pre-1982 fill samples located closest to DP30 (e.g., samples in the southern portion of the LOTT Expansion Site, DP29, MW23S, DP43, DP34, DP38), which is not surprising since DP30 is located a considerable distance from D/F-related AOCs and the historic shorelines where treated wood pilings were likely used. The only DP30 exceedance was a 7-7.5 feet bgs sample of what appeared to be former native sediment mixed with wood debris that was located beneath the pre-1982 fill. As a result, one to two samples will be collected beneath the pre-1982 fill in this boring. One sample will be collected from former native sediment (if encountered) and one sample will be collected adjacent to wood debris (if encountered). If neither former native sediment nor wood debris are encountered beneath the pre-1982 fill, one sample will be collected at roughly the same depth as the DP30 exceedance.
2a	South of DP30 (7-7.5)	SB	DP54[(7)]	D/F	Same depths as 2a for DP53.
2a	West of DP30 (7-7.5)	No sample proposed[6]			
2a	East of DP30 (7-7.5)	RI/FS	DP55 [(7)]	D/F	Same depths as 2a for DP53.
2b	East of DP26 (1-2)	SB	DP52	D/F[5]	Same depths as 1a for DP46.
2c	East of TP02 (2-2.5)	SB	DP51	D/F[5]	Same depth as 1c for DP50.
2d	East of DP42 (1-2, 7-8)	SB	DP56	D/F	Same depths as 1a for DP46.
2e	Northeast of TP03 (3.5-4)	SB	DP50	D/F[5]	Same depth as 1c for DP50.
2f	West of MW24S (6.5-8, 9-10)	SB	DP48	D/F[5]	Same depths as 1a for DP46.
2g	West of TP04 (1.5-2)	No sample proposed[8]			
7	Southwest corner of Parcel 3 (i.e., location of P-1 anomaly)	RI/FS	Not applicable	TPH-D, TPH-HO, PAHs, and PCBs	A limited attempt will be made to remove the P-1 anomaly and any associated impacted soil (e.g., no more than 50 cubic yards total during this limited attempt). Excavated soil and the anomaly will be disposed of at the Weyerhaeuser Regional Landfill in Castle Rock. Four sidewall samples and one bottom sample will be collected following the removal to characterize the surrounding soil conditions.

Notes:

bgs: below ground surface
cPAHs: carcinogenic polycyclic aromatic hydrocarbons
Dioxins/furans: chlorinated dibenzo-p-dioxins and chlorinated dibenzofurans
DP: direct push
PAHs: polycyclic aromatic hydrocarbons
PCBs: polychlorinated biphenyls
RI/FS: Remedial Investigation / Feasibility Study
SB: site boundary
TPH-D: total petroleum hydrocarbons in the diesel range
TPH-HO: total petroleum hydrocarbons in the heavy oil range

[1]Comments dated December 14, 2010 on the Site Boundary Technical Memorandum for the East Bay Redevelopment Site (PIONEER 2010).
[2]The depth of soil screening level exceedance (in feet bgs) for the sample that was referenced in the Ecology comment (e.g., "MW21S") is shown in parenthesis.
[3]Data gaps for the site boundary are differentiated from general RI/FS data gaps. Sampling for these different types of data gaps may be conducted in separate phases.
[4]All borings will be advanced to 15 feet bgs unless otherwise noted.
[5]Samples collected from these locations are being analyzed for both cPAHs and D/F. The depth interval selections will be the same for cPAHs and D/F.
[6]Deeper characterization of potential releases at AOC 1 will be addressed as part of activities at the LOTT Expansion Site.
[7]No sample is proposed northwest of DP30 since the total D/F exceedance in DP30 has already been delineated to concentrations less than the soil screening level in the northwestern direction by BC_DP17. Samples are proposed to the northeast, southwest, and southeast (rather than north, west, south, east).
[8]This screening level exceedance has already been delineated with samples at DP38, which is located west of TP04 (see Figure 2).

Table 2. Soil Sampling Deviations from the Sampling and Analysis Plan/Quality Assurance Project Plan

SAP/QAPP Section	Deviation	Rationale/Explanation
4.0	Work will be executed by PIONEER rather than GeoEngineers.	The Port of Olympia selected PIONEER to perform this work.
2.0	Samples will not be collected every two feet.	One sample will be taken from each major soil lithology that is encountered. Table 1 describes considerations of intervals that will be sampled.
2.0	Water sheen and headspace vapor screening methods will not be used.	Due to the nature of constituents being investigated in this Work Plan, these tests will not be employed.
2.0	Investigation derived waste will be handled differently.	It is anticipated based on previous sampling events that an insignificant volume of decontamination water will be generated and therefore will be discharged on site. It is anticipated based on previous sampling events that an insignificant volume of unused soil cores will be generated. These soils will be placed on-site or will be added to the excavated soils from the southwest corner or Parcel 3 (which are being disposed of at Weyerhaeuser Regional Landfill in Castle Rock).
5.2	Samples will be collected for a 1-foot interval instead of a four to six inch interval.	Given the lithology and actual core recovery, even with two side-by-side borings, typically it is expected to require a one-foot sample interval or longer in order to obtain the minimum required container volume.
5.2	A different GPS unit will be used.	PIONEER has a different GPS unit (which is more accurate than the unit specified in the SAP/QAPP).
8.0	Sample nomenclature will be revised.	To improve data usability during subsequent data evaluations.
11.1	No field trip blanks will be used.	VOCs are not being investigated in this Work Plan.
Table 4	Different target reporting limits will be used.	Reporting limits for the analytical methods and anticipated laboratories are presented in Table 3.

Notes:
GPS: Global Positioning System
SAP: Sampling and Analysis Plan
QAPP: Quality Assurance Project Plan
VOCs: volatile organic constituents

Total Dioxins/Furans Nondetected Value[2,3]	5.7E-06		9.8E-06

Notes:
-- = not applicable
[1]From Table 1 of the Site Boundary Technical Memorandum for the East Bay Redevelopment Site (PIONEER 2010), except for diesel and heavy oil range which are from the East Bay Interim Action Work Plan (PIONEER 2009).
[2]The total cPAHs and total dioxins/furans nondetected values were calculated by multiplying the reporting limit by the toxic equivalency factors as presented in Tables 708-2 and 708-1, respectively, in the MTCA Statute and Regulation Handbook, then adding the values using compound totaling rules described below.
[3]Compound totaling was performed in accordance with Ecology's Concise Explanatory Statement for the Amendments to the Model Toxics Control Act (MTCA) Cleanup Regulation Chapter 173-340 WAC, Publication No. 01-09-043. For congeners that occur at the site (detected in any media), but not detected in that sample, a value of 1/2 the detection limit is assigned. For congeners that do not occur at the site (not detected in any media), a value of zero is assigned. In the case of cPAHs, all congeners have been detected at least once. In the case of PCBs, only one of the seven congeners has been detected. In the case of dioxins/furans, all congeners have been detected at least once.
[4]Even though only one PCB congener has ever been detected at the site, it is possible that they could all be detected, and therefore the total PCBs nondetected value is the total of ½ the reporting limits.

SAMPLING AND ANALYSIS PLAN AND QUALITY ASSURANCE PROJECT PLAN REMEDIAL INVESTIGATION WORK PLAN EAST BAY REDEVELOPMENT, PORT OF OLYMPIA OLYMPIA, WASHINGTON FOR PORT OF OLYMPIA

1.0 INTRODUCTION

This Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP) describe sample collection, handling and analysis procedures associated with the Remedial Investigation Work Plan (RIWP) for the Port of Olympia's (Port) 13-acre East Bay Redevelopment Site (Site). The Site is located in Olympia, Washington, as shown in Figure 1. This SAP must be used in conjunction with the RIWP and the project-specific Health and Safety Plan (HASP).

Detailed descriptions of the field sampling procedures are provided in this document. Site conditions may make it necessary to modify these procedures. Any variations or modifications that become necessary during the investigation will be coordinated with Port personnel, the Washington State Department of Ecology (Ecology) and other involved parties, as appropriate. Variations or modifications implemented during the investigation and the reason for the modification will be documented in field records.

This SAP describes field activities, sampling equipment, sampling locations and procedures that will be used during investigations at the Site. This SAP also includes a QAPP (Section 11), which identifies quality assurance/quality control (QA/QC) procedures that will be implemented during field sampling activities and laboratory analyses.

2.0 PURPOSE AND SCOPE

The purpose of this SAP is to present the detailed procedures that will be used to obtain samples during the supplemental remedial investigation (RI). The objective of this sampling is to provide information to:

- Characterize the nature and extent of contamination at the Site;
- Assess the potential risk to human and ecological receptors; and
- Provide the information that will allow selection of cleanup action alternatives.

Rationale for sample locations and depths and monitoring wells are described in Tables 1 through 3.

Activities to be performed by GeoEngineers during the RI include the following:

1. Update the Project HASP and SAP for use by GeoEngineers' personnel during the RI.
2. Retain public and private utility locating services to identify and locate underground utilities in the exploration areas in coordination with the Port.
3. Retain a concrete coring contractor to core through paved surfaces, as necessary.
4. Monitor the advancement of soil explorations using direct-push and/or hollow-stem auger techniques to depths specific to proposed sample locations. If field screening indicates

contamination is present at the target total depth for a boring, the boring will be advanced until field screening indicates contamination is not present.

a. Soil borings will be located by measuring from known previously surveyed features (roads, existing monitoring wells, etc) and GPS readings.

b. Samples of soil will be collected continuously for the total depth of each boring. Samples for potential chemical analyses will be collected approximately every two feet. Soil will be visually classified in the field according to the Unified Soil Classification System. Contacts between soil lithologies and fill episodes, if feasible, will also be described.

c. Groundwater monitoring wells may be constructed in five borings as described in Table 2.

5. Obtain soil samples as specified in this SAP and the RIWP. Field screening will be performed on each sample using visual, water sheen and headspace vapor screening methods. The field screening results will be used as a general guideline to approximate the vertical extent of petroleum-related contamination in the soil samples. In addition, screening results will be used to aid in the selection of soil samples to be submitted for chemical analysis.

6. Explore the locations and nature of water seeps along the shoreline embankment and collect data to determine if the seeps represent groundwater.

7. Obtain groundwater samples from existing and new monitoring wells for chemical analytical testing using low-flow sampling methodology. Measure depth to water using an electric water level indicator.

a. Collect water samples from seeps if the seeps represent groundwater.

8. Contain soil cuttings, purge water and decontamination water in steel drums and store the drums in a secure location designated by the Port to await off-site transport and disposal. The drums will be labeled according to standard GeoEngineers' practice.

9. Submit soil and groundwater samples to a subcontracted chemical analytical laboratory for chemical analysis. The chemical constituents for each sample have been determined based on existing data and assumptions of the chemicals of potential concern (COPCs) present. Sample locations, depth intervals, and COPCs are described in Tables 1 through 3. The chemical analysis may include one or more of the following:

a. Gasoline-, diesel- and motor oil-range petroleum hydrocarbons by Ecology Methods NWTPH-Gx and NWTPH-Dx,

b. Metals by U.S. Environmental Protection Agency (EPA) Method 6000/7000 series,

c. Volatile organic compounds (VOCs) by EPA Method 8260B,

d. Semivolatile organic compounds (SVOCs) including carcinogenic polycyclic aromatic hydrocarbons (cPAHs) by EPA Method 8270 SIM,

e. Polychlorinated biphenyls (PCBs) by EPA Method 8082, and

f. Dioxins/furans by EPA Method 1613B or Method 8290.

Tables 4 and 5 summarizes the target analytical reporting limits and analytical methods that will be used for soil and groundwater.

10. Document sample methodology and sample locations using detailed field logs.

11. Use database and geographic information system (GIS) technologies to manage chemical analytical data and sample locations.

3.0 PROJECT SCHEDULE

Field work for the supplemental RI will be conducted in phases. The initial phase of the RI will be completed in Fall 2008 in order to provide data critical to the planning of the infrastructure improvement project. The initial phase includes completing eight explorations located in or near the infrastructure corridor. The initial eight exploration locations include borings DP27, DP30, DP32, DP33, DP34, DP36, DP38, and DP40, which are also highlighted on Table 1. The initial phase will also include locating suspected artesian wells, as described in Appendix B of the RI Workplan. Subsequent phase of field work will be completed after data from the first phase has been evaluated and after decommissioning of the artesian wells.

4.0 ROLES AND RESPONSIBILITIES

This section outlines the individuals directly involved with the RI. Work performed under this SAP will be in cooperation with the Port.

Key personnel for this project are as follows:

Position	Name	Affiliation	Telephone Number
Ecology Project Coordinator	Steve Teel	Washington State Department of Ecology	360-407-6247
Port Project Coordinator	Joanne Snarski	Port of Olympia	360-528-8061
Principal-in-Charge	David Cook	GeoEngineers, Inc.	206-728-2674
Project Manager	Jay Lucas	GeoEngineers, Inc.	206-239-3221

- The **Ecology Project Coordinator** is responsible for providing timely technical review and guidance regarding compliance with the Agreed Order (AO) and is responsible for overseeing implementation of the AO for Ecology.
- The **Port Project Coordinator** is responsible for administering the contract with the consultant and is responsible under the AO for overseeing implementation of the AO for the Port.
- The **Principal-in-Charge** works with the Project Manager and is responsible for project document QA/QC review.
- The **Project Manager** reports directly to the Port Project Coordinator and the Principal-in-Charge. The Project Manager is responsible for coordinating project activities and submitting deliverables to the Port. The Project Manager's duties consist of providing concise technical work statements for project tasks, selecting project team members, determining the degree of subcontractor participation, establishing and adhering to budget and schedule, providing technical oversight and providing review of all work.

5.0 FIELD PROCEDURES

The rationale, depths and chemical program for soil and groundwater samples are presented in Tables 1 through 6 of this SAP and are described in the RIWP. The soil and groundwater samples will be obtained and submitted to a Washington State accredited laboratory for chemical analysis.

Note that Sampling and Testing associated with the RI, as outlined in this SAP, includes a phased approach to facilitate early decisions regarding the infrastructure improvements and associated excavation. The phased explorations and testing approach are highlighted in Table 1 of this SAP.

5.1 UNDERGROUND UTILITY LOCATE

Prior to sampling activities, an underground utility locate will be conducted in the area of the proposed sample locations to identify any subsurface utilities and/or potential underground physical hazards.

5.2 SUBSURFACE SOIL SAMPLING

5.2.1 Sample Collection Method

Subsurface soil sampling will be conducted using a direct-push drilling rig equipped with a core barrel lined with disposable acetate sleeves. Soil samples will be obtained every two feet for potential chemical analytical testing and field screening, as described in Table 1. Samples obtained for chemical analytical testing will consist of approximately four- to six-inches of the soil core. The depth of each sample will be measured from the bottom of the sample interval. The depth to the groundwater table, if present, may also be measured at each sample location, using an electric water level indicator.

Samples to be analyzed for gasoline-range petroleum hydrocarbons and VOC analysis following EPA Method 5035A (Ecology 2004) will be obtained first. Samples obtained for non-volatile analyses will be obtained from the same general intervals as the volatile samples. Planned sample depths are based on results from earlier studies and are outlined in Table 1. Sample containers will be labeled in the field and stored in an iced cooler prior to and during shipment to the chemical analytical laboratory.

Sampling activities will be conducted by a GeoEngineers representative, and soil will be visually classified in the field according to the Unified Soil Classification System (USCS) and American Society for Testing and Materials (ASTM) Standard 2488.

Field personnel will record the sample locations using hand-held Trimble GeoXT global positioning system (GPS) units with sub-meter accuracy during sampling activities. Sub-meter accuracy standards will be used during data collection to record latitude and longitudinal data. A minimum of four satellites will be required for a position dilution of precision (PDOP) value of less than 6. Satellite elevation must be at least 15 degrees above the horizon, with a minimum signal-to-noise ratio (SNR) of 39 bBHz. GPS data collected in the field will be subsequently processed in the office using measurements from the nearest reference station to each collection point.

5.2.2 Sample Locations

Twenty-two new boring locations are planned and shown in Figures 2 and 3. The borings are placed in areas to further evaluate the lateral and/or vertical extent of contamination that has been identified in previous studies. The rationale for sample locations and depth intervals are described in Table 1.

5.2.3 Phase 1: Infrastructure Construction Corridor Sample Locations

Locations of eight borings are within utility corridors associated with the infrastructure improvements. These borings may be completed during an initial phase of exploration to accommodate the construction schedule. These borings are highlighted in Table 1 and Figure 2. Sampling in the infrastructure corridor will provide data to characterize soil that will be removed during excavation activities.

5.3 FIELD SCREENING

Field screening for evidence of possible contamination will be performed on soil samples obtained from the explorations. Field screening results will be recorded on the field logs, and the results will be used as a general guideline to delineate areas of possible contamination. Screening results will be used to aid in the selection of soil samples to be submitted for chemical analysis. The following screening methods will be used: (1) visual screening, (2) water sheen screening and (3) headspace vapor screening. Visual screening and water sheen screening are qualitative methods; therefore, precision, accuracy and detection limits are not quantified for these methods. Headspace vapor screening is a semi-quantitative method; however, precision and accuracy will not be quantified for this method. Instrument accuracy and detection limits are described below. Field screening results are site- and location-specific. The results may vary with temperature, moisture content, soil type and chemical constituent.

5.3.1 Visual Screening

The soil will be observed for unusual color and stains and/or odor indicative of possible contamination.

5.3.2 Water Sheen Screening

A portion of the soil sample will be placed in a pan containing distilled water. The water surface will be observed for signs of sheen. The following sheen classifications will be used:

Classification	Identifier	Description
No Sheen	(NS)	No visible sheen on the water surface
Slight Sheen	(SS)	Light, colorless, dull sheen; spread is irregular, not rapid; sheen dissipates rapidly
Moderate Sheen	(MS)	Light to heavy sheen; may have some color/iridescence; spread is irregular to flowing, may be rapid; few remaining areas of no sheen on the water surface
Heavy Sheen	(HS)	Heavy sheen with color/iridescence; spread is rapid; entire water surface may be covered with sheen

5.3.3 Headspace Vapor Screening

Headspace vapor screening will be performed on a portion of the soil sample placed into a resealable plastic bag. Ambient air will be captured in the bag; the bag will be sealed and then shaken gently to expose the soil to the air trapped in the bag. The bag will remain closed for approximately 5 minutes at ambient temperature before the headspace vapors are measured. Vapors present within the sample bag's headspace will be measured by inserting the probe of a photoionization detector (PID) through a small opening in the bag. A PID measures the concentration of organic vapors ionizable by a 10.6 electron volt (eV) lamp in parts per million (ppm) and quantifies organic vapor concentrations in the range between 0.1 ppm and 2,000 ppm (isobutylene equivalent) with an accuracy of 1 ppm between 0 ppm and 100 ppm. The maximum value on the instrument and the ambient air temperature will be recorded on the field log for each sample. The PID will be calibrated to 100 ppm isobutylene.

5.4 GROUNDWATER SAMPLING

5.4.1 Monitoring wells

Groundwater will be sampled from 17 existing and new monitoring wells for chemical analytical testing as shown in Table 3. Monitoring wells will be sampled using low-flow sampling methodologies, as described below.

- Prior to sampling, measure depth to water with an electric water level indicator.
- Purge groundwater from the monitoring wells using dedicated tubing, a peristaltic pump (or equivalent), a flow-through cell and water parameter analyzer (Horiba U-20). Purge monitoring wells using a flow rate between 100 and 500 milliliters per minute (mL/min) that does not create significant drawdown in the well. When field parameters have stabilized or at least three well volumes of water have been purged from the well, disconnect the flow-through cell and sample groundwater directly from down-well tubing, maintaining a low-flow pumping rate. Water quality parameters to be monitored during purging include: conductivity, dissolved oxygen, pH, salinity, total dissolved solids, turbidity, oxidation-reduction potential and temperature.
- Place each groundwater sample directly into a laboratory-prepared sample container, label the container, log the sample on the chain-of-custody and sample collection form, and place the container into a cooler with ice.

5.4.2 Groundwater Seeps

Greylock Consulting identified four seep locations along the shoreline during a low tide on July 16, 2008. These locations, as well as other seep locations that may be identified during site visits, will be evaluated to determine if they represent groundwater rather than surface water, irrigation water or discharge from buried pipes.

The evaluation will be based on several lines of evidence that will include:

- Physical observations of the proximity of the seeps to known utilities that could represent areas where water leaks from stormwater drains or from the fill around buried utilities.
- Explore the soil above the seeps to determine if the soil is saturated above the seepage point, and follow the saturation to its point of origin. This exploration will be conducted with hand digging equipment.
- Measure the temperature, salinity and conductivity of the water discharging from the seeps and compare these values to that representative of groundwater and of marine water. This will help determine if the seeps represent delayed drainage of sea water, rather than groundwater.
- Determine if the seeps originate at a higher elevation that the groundwater table. If a seep originates above the elevation of the groundwater table or high tide elevation that day, it is evidence that the seep does not represent groundwater. The elevation of the groundwater table will be based on water levels measured in the nearest monitoring well during the high tide and the low tide of that day's tidal cycle.

If water from an area of seepage is identified as groundwater, a representative sample will be collected for chemical testing as identified in Table 3. The sample will be collected by pushing a short PVC pipe into the seep so the water drains from the end of the pipe. Following insertion of the PVC pipe, a sample of the water will be collected after turbidity caused by the initial disturbance has descreased. Conductivity, temperature, and salinity water quality parameters will be measured as described above for the monitoring well samples. Up to four samples representative of groundwater seeps will be collected. The PVC pipe will be decontaminated prior to collection of each sample.

5.5 FIELD EQUIPMENT CALIBRATION PROCEDURES

Field equipment requiring calibration will be calibrated to known standards in accordance with manufacturers' recommended schedules and procedures for each instrument. If field equipment becomes inoperable, it will be replaced with a properly calibrated instrument.

6.0 CHEMICAL ANALYTICAL PROGRAM

All samples will be submitted to a Washington State accredited laboratory. Tables 1 and 3 summarize the chemical analyses for soil and groundwater samples from monitoring wells, respectively. Tables 4 and 5 summarize the target analytical reporting limits.

7.0 SAMPLE HANDLING AND CUSTODY REQUIREMENTS

The following procedures will be used when obtaining soil and/or groundwater samples during the investigation activities.

- Dedicated nitrile gloves will be worn when obtaining each sample, including quality control (QC) samples.
- Soil samples obtained for chemical analysis of gasoline-range petroleum hydrocarbons and VOCs will be obtained using EPA Method 5035A.
- Samples obtained for chemical analysis will be transferred into clean sample containers supplied by the analytical laboratory. Table 6 lists the sample containers to be used.
- Sufficient sample volume will be obtained for the laboratory to complete the method-specific QC analyses on a laboratory-batch basis.
- Sample labels will be completed for each sample following the procedures provided in this section. Immediately after the samples are obtained, they will be stored in a cooler with ice until they are delivered to the analytical laboratory.
- Standard chain-of-custody procedures will be followed for all samples obtained.

7.1 CUSTODY SEALS

Custody seals are signed and dated seals that are affixed to the lid of a shipping container (for example, cooler) and are used to indicate if the container has been opened before it reaches the intended recipient. Custody seals will be attached to containers by GeoEngineers personnel before they are transferred to the chemical analytical laboratory.

7.2 CUSTODY PROCEDURES

Chain-of-custody procedures will be used to track the possession of the samples from the time they are obtained in the field through analysis and final disposition. Each time the samples change hands, both the sender and receiver will sign and date the chain-of-custody record form. A chain-of-custody record form will be used to track possession of the samples and to document the analyses requested. The form will be completed at the end of each sampling day prior to transfer of samples off-site and will accompany the samples during transfer to the laboratory.

When the samples are shipped to the laboratory via common carrier, one copy of the chain-of-custody record form will be retained for project files, and the remaining copies will be enclosed in a plastic bag and secured to the inside of the cooler prior to shipment.

Upon receipt of the samples at the laboratory, the custody seals will be broken, the chain-of-custody form will be signed as received by the laboratory, and the conditions of the samples will be recorded on the form. The original chain-of-custody form will remain with the laboratory, and copies will be returned to the relinquishing party.

8.0 DOCUMENTATION OF FIELD ACTIVITIES

Daily field activities, including observations and field procedures, will be recorded on appropriate forms. The original field forms will be maintained in GeoEngineers' office files. Copies of the completed forms will be maintained in a sequentially numbered field file for reference during field activities. Photographic documentation of field activities will be performed as appropriate.

8.1 SAMPLE DESIGNATION

Each sample obtained during field activities will be identified by a unique sample designation. The sample designation will be included on the sample label. For soil samples, the designation also will be included with the corresponding sample information on the appropriate field log. For groundwater sampling from monitoring wells, the corresponding sample information will be recorded on the monitoring well sampling field sheet. The following sample designation system will be used for this project.

All samples will be assigned a unique identification code based on a consistent sample designation scheme. The sample designation scheme is designed to suit the needs of the field staff, data management and data users. All samples will consist of three components separated by a dash. These components are station code, date and sample interval. The sample designation scheme is as follows:

Station Code	Date	Sample Interval
SSnn	YYMMDD	XXX
MWnn	YYMMDD	W

The three components are described below.

8.1.1 Station Code

The station code component is a four-character code that uniquely identifies each sampling station. The station code component has two parts: a two-letter station designation ("SS" or "MW") followed by a sequential two-digit number component "nn." The two-letter "SS" designation will be determined by how the soil sample was obtained (for example, drilling method, grab) as described below. The sequential "nn" component will begin at 26 (that is, 26, 27, 28) to accommodate samples previously obtained at the Site during previous studies. For groundwater samples, the "MWnn" designation will correspond to the monitoring well number (for example, MW25S).

The station designations are:

- DP – Direct-Push
- SB – Soil Boring using Hollow-Stem Auger (HSA) Drilling Techniques
- TP – Test Pit
- GB – Grab Sample

8.1.2 Date

The date component is a six-character code that presents the date that the sample was obtained in the following format: year, month, day (YYMMDD).

8.1.3 Sample Interval

The sample interval component corresponds to sample depth for soil samples, and is a three-character code that identifies each sampling interval. Soil sample depth determinations will be made to the nearest 0.5 foot, with the depth determination representing *either* the sample collection point (for VOC) *or* the beginning of the sampling interval (that is, 050 will represent the 5- to 5.5-foot interval). For groundwater, a "W" will be used for the sample interval component.

8.1.3.1 Field Quality Control (QC) Samples

Field QC samples will be identified by adding characters to the end of the sample interval field. The following characters are associated with the following field QC sample types:

- TB – VOC trip blank
- DUP – duplicate sample

8.1.4 Examples

Examples of complete sample numbers with descriptions are as follows:

- DP30-080825-020 A field sample collected at station DP30 on August 25, 2008, from 2 to 2.5 feet bgs.
- MW04-080825-W A groundwater sample collected at monitoring well MW04 on August 25, 2008.

Under the sample designation method described above, the identifier will be unique (that is, no two samples will have the same identifier) and informative (that is, location, date and sample interval). This designation scheme will facilitate overall data management and submittal into Ecology's Environmental Information Management (EIM) database.

8.2 SAMPLE LABELING

Sample information will be printed legibly onto the sample labels in indelible ink. Field identification will be sufficient to enable cross-reference with the project logbook.

To minimize handling of sample containers, labels will be completed before sample collection to the extent possible. The label will be filled out completely in the field and attached firmly to the sample container. The sample label will provide the following information:

- GeoEngineers' job number
- Sample designation
- Date of sample collection (month/day/year)
- Time of sample collection (hours: minutes)
- Chemical analyses to be conducted

- Sample preservation, if applicable
- Initials of sampler

8.3 FIELD LOGBOOKS AND DATA FORMS

Field logbooks (or daily logs) and data forms are necessary to document daily activities and observations. Documentation will be sufficient to enable participants to reconstruct events that occurred during the project accurately and objectively at a later time. All entries will be written in ink, dated and signed daily. No pages will be removed from logbooks for any reason. If corrections are necessary, these corrections will be made by drawing a single line through the original entry (so that the original entry is legible) and writing the corrected entry alongside. The correction will be initialed and dated. Corrected errors may require a footnote explaining the correction.

8.4 PHOTOGRAPHS

Documentation of a photograph is crucial to its validity as a representation of an existing situation. The following information will be noted in the field logbook or data forms concerning photographs:

- Date, time and location where photograph was taken
- Photographer
- Description of photograph taken
- Sequential number of the photograph and the film roll number, or sequence in the digital log
- Compass direction

9.0 DECONTAMINATION PROCEDURES

The objectives of decontamination procedures are to minimize the potential for cross-contamination between individual samples, to prevent contamination from leaving the sampling site by way of equipment or personnel and to prevent exposure of field personnel to contaminated materials. This section discusses general decontamination procedures.

9.1 PERSONNEL

Personnel decontamination procedures depend on the level of protection specified for a given activity. The HASP identifies the appropriate level of protection for each type of fieldwork involved in this project, as well as appropriate decontamination procedures.

9.2 SAMPLING EQUIPMENT

Decontamination procedures are designed to remove trace-level contaminants from sampling equipment to prevent cross-contamination of samples. Non-dedicated sampling or measurement equipment, including stainless steel sampling tools, soil sampling equipment and water level measurement instruments, will be decontaminated prior to and after each sampling attempt or measurement by washing with a nonphosphate detergent solution (for example, LiquiNox® and distilled water) and rinsing with distilled water.

10.0 INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW) generated from the subsurface investigations will be contained in 55-gallon steel drums and temporarily stored in a secured location as designated by the Port. The IDW is

anticipated to consist of soil cuttings, decontamination water, monitoring well development and purge water. The IDW will be separated by media (that is, soil and water) and labeled appropriately. Chemical analytical results from soil and groundwater sample analyses may be used to profile IDW for disposal at an appropriate off-site disposal facility. Solid waste from sampling activities (used gloves, tubing, etc.) will be contained in plastic trash bags and disposed as solid waste.

11.0 QUALITY ASSURANCE PROJECT PLAN

11.1 QUALITY ASSURANCE OBJECTIVES

The general quality assurance (QA) objectives for this project are to develop and implement procedures for obtaining and evaluating data of a specified quality that can be used to assess site conditions and risks. Field QA procedures to be followed include completing all appropriate sample documentation. Measurement data should have an appropriate degree of accuracy and reproducibility; samples obtained should be representative of actual field conditions, and samples should be obtained and analyzed using proper chain-of-custody procedures.

11.2 FIELD QA/QC PROCEDURES

Field QA/QC procedures to be followed include completing all appropriate sample documentation and preservation. One trip blank will be placed in each sample shipping container (for example, cooler) and analyzed for VOCs.

11.2.1 Trip Blanks

The analytical results of field trip blanks will be reviewed to evaluate the possibility for contamination resulting from the laboratory-prepared sample containers or the sample transport containers. Trip blanks will be analyzed at a frequency of one for each shipment of samples containing field samples for chemical analysis of VOCs. The trip blanks will be labeled with a "TB" sample identifier as described earlier in the "Sample Designation" section (Section 8.1) and delivered to the laboratory with the normal shipment of samples.

11.2.2 Sample Preservation and Containers

Samples will be kept in a cooler with ice before and during transport to the laboratory. The sampling extraction and analysis dates will be reviewed to confirm that extraction and analyses were completed within the recommended holding times, as specified by EPA protocol. Appropriate laboratory-assigned data qualifiers will be noted if holding times are exceeded or containers do not contain the appropriate sample preservation. Table 6 summarizes sample preservation and containers.

11.3 LABORATORY QA/QC PROCEDURES

The data quality objectives will be met in the laboratory by using established instrument calibration and sample handling procedures, analysis according to standard analytical methods and analysis of quality control samples. Laboratory quality control will consist of analysis of surrogate spikes, method blanks, duplicates, matrix spikes and matrix spike duplicates and reporting of all data including holding times.

11.3.1 Equipment Calibration Procedures and Frequency

All instruments and equipment used by the laboratory will be operated, calibrated and maintained according to manufacturer's guidelines and recommendations. Operation, calibration and maintenance

will be performed by personnel who have been properly trained in these procedures. A routine schedule and record of instrument calibration and maintenance will be kept on file at the laboratory.

11.3.2 Analytical Procedures

Samples will be analyzed according to analytical methods listed in Tables 1, 3, 4 and 5. EPA standard analytical methods are specified in *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW-846* (through update III), dated December 1996. Washington analytical methods for petroleum hydrocarbons are specified in the Model Toxics Control Act (MTCA) regulations, as outlined in Washington Administrative Code (WAC) 173-340.

11.3.3 Laboratory QA/QC Samples

Laboratory QC samples will be analyzed at a frequency of 5 percent (1 in 20) on a laboratory batch basis. Laboratory QC samples will consist of duplicates, method blanks, matrix spikes and matrix spike duplicates. In addition, each organic analysis will include addition of surrogate compounds to the sample for surrogate spike analysis.

11.3.4 Laboratory Deliverables

The following information will be provided in the laboratory reports submitted for this project:

- Transmittal letter, including information about the receipt of samples, the testing methodology performed, any deviations from the required procedures, any problems encountered in the analysis of the samples, any problems meeting the method holding times or laboratory control limits, and any corrective actions taken by the laboratory relative to the quality of the data contained in the report.
- Sample analytical results, including sampling date, date of sample extraction or preparation, date of sample analysis, dilution factors and test method identification; soil sample results in milligrams per kilogram (mg/kg), micrograms per kilogram (µg/kg) or nanograms per kilogram (ng/kg); and detection limits for undetected analytes. Results will be reported for all field samples, including field duplicates and blanks submitted for analysis.
- Method blank results, including reporting limits for undetected analytes.
- Surrogate recovery results and corresponding control limits for samples and method blanks (organic analyses only).
- Matrix spike/matrix spike duplicate and/or blank spike/blank spike duplicate spike concentrations, percent recoveries, relative percent differences and corresponding control limits.
- Laboratory duplicate results for inorganic analyses, including relative percent differences and corresponding control limits.
- Sample chain-of-custody documentation.

The raw analytical data, including calibration curves, instrument calibration data, data calculation work sheets and other laboratory support data for samples from this project, will be compiled and kept on file at the laboratory's office for reference.

11.4 REVIEW OF FIELD AND LABORATORY QA/QC DATA

The sample data, field and laboratory QA/QC results will be evaluated for acceptability with respect to the RI data quality objectives (DQOs). Each group of samples will be compared with the DQOs and

evaluated using data validation guidelines contained in the following documents: *Guidance Document for the Assessment of RCRA Environmental Data Quality*, draft dated 1988 and *National Functional Guidelines for Organic Data Review*, draft 1999. To accomplish data evaluation, the criteria listed in the following subsections will be assessed.

11.5 PRECISION, ACCURACY AND COMPLETENESS

11.5.1 Precision

Precision is a measure of data variability. Variability can be attributed to sampling activities and/or chemical analysis. Relative percent difference (RPD) is used to assess the precision of the sampling and analytical method and is calculated as follows.

RPD = 100[(Xs - Xd)/(Xs + Xd)]/2

where

RPD	=	relative percent difference
Xs	=	sample analytical result
Xd	=	duplicate sample analytical result

11.5.2 Accuracy

Accuracy is a measure of the error between chemical analytical results and the true sample concentrations. Accuracy is a measure of the bias in a system and will be expressed as the percent recovery of spiked samples. The accuracy will be presented as percent recovery and will be calculated as follows.

PR = 100(Xss - Xs)/T

where

PR	=	percent recovery
Xss	=	spike sample analytical result
Xs	=	sample analytical result
T	=	known spike concentration

11.5.3 Completeness

Completeness is evaluated to assess whether a sufficient amount of valid data is obtained. Completeness is described as the ratio of acceptable measurements to the total planned measurements. Completeness is calculated as follows.

C = (Number of samples having acceptable data)/
(total number of samples analyzed) x 100%

where

C	=	completeness

11.6 REPORTING, DOCUMENTATION, DATA REDUCTION AND CORRECTIVE ACTION

Upon receipt of each laboratory data package, data will be evaluated against the criteria outlined in the previous sections. Any deviation from the established criteria will be noted and the data will be qualified, as appropriate. A review and discussion of analytical data QA/QC will be submitted in a report to be attached to the RI report. Data validation procedures for all samples will include checking the following, when appropriate.

1. Holding times
2. Detection limits
3. Field equipment rinseate blanks
4. Laboratory blanks
5. Laboratory matrix spikes
6. Laboratory matrix spike duplicates
7. Laboratory blank spikes
8. Laboratory blank spike duplicates
9. Surrogate recoveries

If significant quality assurance problems are encountered, appropriate corrective action as determined by GeoEngineers' project manager and/or the chemical analytical laboratory will be implemented as appropriate. All corrective action will be defensible, and the corrected data will be qualified.

Spatial information collected during the field event will be analyzed and displayed using ArcGIS 9.1 and EQUIS 3 to manage the chemical analytical data.

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses								Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
				NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]		
1. Additional characterization is needed to define the extent of soil contamination at the site. The aerial and vertical extent of soil contamination needs to be further defined in the vicinity of DP02 and DP04 (including westward beneath Jefferson Street and on adjacent offsite parcels if necessary) and north of DP18.	TPH-D, TPH-MO, arsenic, and cadmium in the 2-6 feet interval were the only COPC exceedances at DP04. These COPCs have been delineated laterally in this interval to the northeast and south with MW08 and DP03, respectively. A new soil boring will be advanced northwest of DP04 to complete the lateral delineation of COPC screening level exceedances in the 2-6 feet interval. Soil samples will also be obtained from beneath existing railroad tracks to be removed during infrastructure construction activities. The railroad tracks are currently embedded in the asphaltic pavement along Jefferson Street and we expect that the section beneath the pavement will consist of railroad ties supporting the rail and ballast material (typically 3 feet of crushed rock) supporting the ties. Soil samples will be collected at the soil/ballast interface. We will analyze soil collected beneath the ballast material for cPAHs (using EPA Method 8270C), TPH, and metals to assess potential residual soil contamination associated with the ties.	DP37	0-2										
			2-6	x [a]	X	X	x		x	X			light sand fill
			6-10	X	X	X	x			X			dark sand fill
	TPH-MO in the 2-6 feet interval was the only significant COPC exceedance at DP02. This COPC has been delineated laterally in this interval to the north and southeast with DP03 and DP16, respectively. A new soil boring will be advanced southwest of DP02 to complete the lateral delineation of the TPH-MO screening level exceedance in the 2-6 feet interval. A sample from 10 to 14 feet from the monitoring well boring for MW25S will be tested for TPH-MO to evaluate the vertical extent of this COPC identified in previous samples from DP02. Proposed shallow screen interval for MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04. Soil samples from below the railroad tracks will also be collected and analyzed from DP38 and analyzed for PAHs. PAHs will be tested in sample from 10 to 14 foot depth interval in the boring for MW25S to evaluate the vertical extent of this COPC identified previously at DP02 and DP16. One sample from DP38 will be tested for dioxins/furans to evaluate soil within the infrastructure corridor.	DP38	1-3				x		x				
			4-6	x	X	X	x	x	x		x		light sand fill
			6-10	X	X	X	x	x	x		x	9	Silt or dark sand fill
		MW25S	0-2										
			2-6										
			6-10	x	X	X	X		X				Silt or dark sand fill
			10-14	x	X	X	X		x				Silt or dark sand fill
	TPH-MO in the 10-14 feet interval was the only significant potential COPC exceedance at DP18. This COPC has been delineated latreally in the vadose zone and saturated zone with MW03, MW16, and DP17 but has not been delineated laterally north of DP18. Soil samples from the boring for MW23S will provide this information. Proposed screen interval for MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18. TPH-MO will be tested in MW-23S at the 6 to 10 and 10 to 14 foot intervals to evaluate the vertical extent of TPH-MO identified previously at DP18.	MW23S	0-2										
			2-6										
			6-10	x [a]	X	X	X		X				light sand fill
			10-14	x	X	X	X		X				light sand fill
2. Additional characterization is needed to define the extent of soil contamination at the site. The vertical extent of contamination needs to be defined in the vicinity of DP06 and DP08.	TPH-G in the 2-6 feet interval was the only significant potential COPC exceedance at DP06 and needs to be defined at depth and to the south. TPH-D and TPH-MO in the 2-6 feet interval were the only significant potential COPC exceedances at DP08. TPH-D and TPH-MO exceedance was identified in the 2-6 feet interval in DP-13. The vertical extent of gasoline, diesel and oil contaminated soil has been delineated with DP24, DP15, DP14, MW-5, MW-8 and MW-10. MW24S, along with the other proposed and existing wells, will be used to evaluate the leaching to groundwater pathway via empirical demonstration per WAC 173-340-747(9) an (10)(c). Proposed shallow screen interval for MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	MW24S	4-6	X	X	X	X		X				
			6-10	X	X	X	X		X				
	Evaluate lateral extent of TPH-D and MO identified previously at DP08 and DP13. Evaluate lateral extent of gasoline exceedance at DP08 and DP13.	DP39	0-2	X	X	X	X		X				
			2-6	x [a]	X	X	X		X				dark sand fill
	Lateral and vertical extent of dioxins/furans by TP03. Evaluate thickness of pre-1891 fill. Collect data to support management of soil that will be excavated as part of the infrastructure improvements. DP40 will also help evaluate the extent of diesel and oil contamination previously observed in DP13 and DP08 at 2-6 feet.	DP40	0-2	x	X	X	x	x	x				light sand fill
			2-4	x	X	X	x	x	x		x		light sand fill
			4-6	x	X	X	x	x	x		x	3.5	dark sand fill
3. Additional characterization is needed to define the extent of soil contamination at the site. The aerial extent of contamination has not been defined in the vicinity of MW19.	TPH-G in the 2-6 feet interval was the only potential COPC exceedance at MW19. Two soil borings (DP28 and the boring for MW21s) will be located near MW19 to evaluate the aerial extent of the screening level exceedance of TPH-G at MW19 in the 2-6 feet interval. The proposed screen interval (2 to 7 feet bgs) for MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19. Moreover, a soil boring advanced to the west of MW19 in response to Ecology Comment #7 (i.e. DP27) will also be sampled for TPH-G in the 2-6 feet interval to provide lateral delineation to the west. To address Ecology comment 7, if evidence of burned wood or ash is observed in boring DP28, which is located on the northern edge of parcel 1 near the former Refuse Fire Area, a sample of this material will be analyzed for dioxins and furans.	DP28	0-2	X	X	X	X						
			2-6	X	x	X	X						light sand fill
		MW21S	0-2										
			2-6		x [a]								light sand fill

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
4. Additional characterization is needed to define the extent of soil contamination at the site. Area of Concern (AOC) #16 (pad mounted transformer) needs to be evaluated. Soil samples should be collected from this area for petroleum hydrocarbons and PCBs. The location of well MW04 does not appear to be close enough to this AOC to be adequate.	One new boring will be advanced and sampled within AOC 16 as recommended by Ecology. The targeted depth for the soil sample collected from this boring is the elevation of the former transformer pad located in AOC 16. The sample from this boring will be analyzed for PCBs and mineral oil range petroleum hydrocarbons (NWTPH-Dx).	DP35	0-2										
			2-6	x						x			gravel fill
5. Parcel 1 needs to be assessed. AOCs #43 through 48 and #50 have not been adequately assessed. Also, the northern portion of Parcel 1 needs to be assessed.	The first sentence of this comment does not apply because the East Bay Redevelopment Project Area only includes the northwest portion of Parcel 1. A new boring (DP36) located in the right-of-way of Olympia avenue adjacent to the northwest portion of Parcel 1will address Ecology's concern regarding the northern portion of Parcel 1. However, the primary purpose of this boring is to evaluate soil conditions to assist in planning of future infrastructure improvements in this area and evaluate residual concentrations of COPCs in an area where historical sources were not located.	DP36	1-3					x					gravel fill
			2-6	x	x	X	x	X					silt
			6-10					X				9	silt
6. Additional characterization of dioxins/furans is needed. As shown in the report, concentration of dioxins/furans that exceed the MTCA Method B Soil Cleanup Level of 11 nanograms per kilogram (ng/kg) or parts per trillion (ppt), expressed as a Total Toxicity Equivalency Factor (TEF), were observed at all four locations tested for this constituent. The reported TEF values from these locations range from 57.9 to 645 ng/kg. Because the highest concentration (TP02) is near the east property line and near an adjacent public walking path and grassy area, additional samples for dioxins/furans should be collected in this adjacent area. Also, an analysis of wind direction should be performed to help predict locations that may show higher dioxin concentrations.	New boring DP33 will provide vertical profile of dioxins/furans concentrations near TP2. Selection of sample locations based on prediction of wind direction is not necessary because the proposed dioxins/furans sample locations (as outlined in this table) provide spatial coverage across the site.	DP33	0-2					x	x	x			gravel fill
			2-4				x	x	x		x		gravel fill
			4-6				x	x	x				light sand fill
			6-8					x				9	light sand fill
7. Additional characterization of dioxins/furans is needed. Parcel 7 is located adjacent to the Refuse Fire Area (Area of Concern #1), which is a potential source of dioxins/furans contamination. Additional soil samples for dioxins/furans analyses should be performed in Parcel 7. These samples will provide additional dioxins/furans data for the site and may help to determine whether AOC #1 was a source.	Additional samples which address Ecology's comment 7 will be collected and tested for dioxins/furans from a boring advanced near AOC 1 (DP27) and a boring advanced at the northern edge of Parcel 7 (DP28). In addition, DP27 will be sampled for TPH-G to address gasoline contamination identified in soil at MW-19 (see response to Ecology Comment #3). Samples from boring DP27 will also be analyzed for PAHs to evaluate the lateral and vertical extent of cPAHs identified in soil samples from MW-20, near the Refuse Fire Area. Note that Parcel 8, which is adjacent to the northwest portion of the Site, is being addressed by LOTT Alliance through Ecology's Voluntary Cleanup Program.	DP27	0-2					x	x	x			light sand fill
			2-4		x	X	x	x	x		x		light sand fill
			4-6				x	x	x		x		silt
			6-8				x	x				3	silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
8. Additional characterization of dioxins/furans is needed. Section 4.3.1 states that "dioxin testing appears to indicate that the historical working surface (depth of about 2 feet below existing grade) is impacted." Please provide more detail on what is meant by "historical working surface" and how it is distinguished. According to the Supplemental Site Use History report, the boiler house (AOC #17) operated circa 1932 and the power house (AOC #22-24) operated from at least 1941 through 1958. Was 2.0 feet below current grade the historical grade for these facilities? If so, what evidence is there for this? Dioxin samples were collected at the 2.0 foot depth at AOC #17, at the 3.5 depth at AOC #22-24, and at the 1.5 and 2.0 foot depths at the two randomly selected locations. It is recommended that additional samples be collected at AOC #17 so that a concentration verses depth profile can be determined.	The "historical working surface" is the sometimes woody and compacted historical grade where industrial buildings were located and operations were conducted on the property prior to later filling and grading. Based on our review of historical information the working surface is located about 1 to 4 feet below existing grade, however it can be difficult to identify in borings due to similarity in lithology of fill in this depth interval. Because of Ecology's questioning of the historical working surface and difficulty in determining its exact location in borings, a more appropriate rationale for the location of explorations where vertical profiles for dioxins/furans testing is as follows:1) complete a profile (DP33) adjacent to previous sample with high dioxins concentrations (TP02) and 2) complete a profile that represents temporal fill sequences.	See DP 33 (Comment 6) and borings and "Additional Explorations" rationale below.										
9. Additional characterization of groundwater contamination, flow direction, and gradient is needed. Groundwater monitoring wells MW-1 through MW·11 and MW-14 were installed with their screened interval submerged below the water table. Wells that monitor for light non-aqueous phase liquids (LNAPL, such as petroleum hydrocarbons) should be completed so that their screen straddles the water table. Therefore, to accurately evaluate whether groundwater is contaminated from LNAPL constituents, it will be necessary to install additional groundwater monitoring wells with screens that extend above the water table at selected locations where the existing monitoring wells are not adequate. Please present your proposed new well locations to us for review and approval.	Given the general lack of dissolved-phase petroleum constituent detections in the groundwater samples collected from existing MWs (as well as the relatively low TPH soil concentrations detected in soil samples collected from areas with suspected hydrocarbon contamination), it is unlikely that the typical placement of the screened intervals straddling the water table would result in measurable LNAPL thicknesses or even a screening level TPH exceedance at any MW at this site. Nonetheless, five shallow MWs (MW21S through MW25S) with screens straddling the water table are proposed to address this comment. MW21S and MW24S are discussed in the responses to Ecology Comments #2 and #3, respectively. Proposed MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06. MW23S and MW25S are discussed in the response to Ecology Comment #1. This Ecology comment is further addressed by in the Groundwater Monitoring Plan. Based on recent comments from Ecology (9/22/08 Ecology comment letter and subsequent discussion), because artesian wells at the Site may be influencing shallow groundwater, an attempt will be made to locate and decommission or otherwise mitigate leakage from the artesian wells. If the artesian wells are found and decommissioned, water levels and the need for shallow monitoring wells will be reevaluated.	MW22S	No analysis of soil samples unless field observations indicate the presence of contamination. Anticipated screened interval is 1-6 feet bgs.									
Additional Explorations													
Additional explorations to evaluate the nature and extent of contamination, including dioxins/furans. These explorations will provide data related to: a) regional area background concentrations of dioxins/furans and metals not related to a site release, b) management of soil that will be excavated as part of the infrastructure improvements, and c) evaluation of COPC distribution in different fill types and spatial coverage related to general extent of COPCs.	Evaluate extent of lead and PAHs at DP11.	DP29	0-2						x				light sand fill
			2-6				x						silt or gravel
			6-10				x						silt or gravel
			10-14						x				silt or gravel
	Evaluate dioxins/furans in fill (1891 to 1908 time interval), evaluate dioxins/furans in soil within the infrastructure corridor, and provide additional sampling data for parcel 9.	DP30	0-2				x	x					light sand fill
			2-4				x	x	x				light sand fill or silt
			6-8				x	x (if silt)				9	light sand fill or silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration	Sampling Depth Interval (ft bgs)[1]	Soil Analyses								Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
		Boring (DP) Well (MW)		NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]		
	Locations DP31 and DP41 are selected to obtain dioxins/furans data from soil not associated with any AOC source. This data will be used to evaluate dioxins/furans concentrations related to regional dioxin sources and regional background levels as it is possible that detected concentrations of dioxins/furans and metals in soil samples collected to date are attributable to an area or regional background rather than a site release. DP31 is located on parcel 6 in an area where no historical sources (AOCs) were located and the underlying fill is from the 1948 to 1975 time period. DP41 is located on parcel 2 in an area where no historical sources (AOCs) were located and the underlying fill is from the post 1975 time period.	DP31	0-2					x					light sand fill
			2-6	x			x	x					light sand fill
		DP41	0-2					x					gravel fill
			2-6				x	x					silt
	Evaluate dioxins/furans in post-1975 fill within the infrastructure corridor. These data will assist with evaluating background conditions as well as inform waste characterization and disposal associated with the excavated infrastructure corridor soils.	DP32	0-2					x			x		gravel fill
			2-6				x	x	x		x		gravel fill
			6-9					x				9	gravel fill
	Evaluate dioxins/furans in fill (1891 to 1908 time interval) near infrastructure corridor and on Parcel 4.	DP34	0-2					x					light sand fill
			2-6	X	X	X	x	x	x		x		light sand fill
			8-10	X	X	X	x	x	x			10	light sand fill or gravel
	These borings are located on Parcel 4 and the locations were selected to gather information to support soil characterization during construction activities associated with the Children's Hands on Museum.	DP26	0-2				X	x	X				light sand fill
			2-6					x	X				silt or light sand fill
			6-10				X	X					
		DP42	0-2				X	x					gravel fill
			2-6				X	x					light sand fill
			6-10				X	X					

Notes:

Blank boxes (no X) indicate that soil samples will be collected from the specified depth intervals and held for potential analyses by the analytical laboratory

Shaded cells indicate explorations and samples that will be collected in first phase of investigation

[1] Samples will be collected approximately every 2 feet in soil borings for field screening and potential chemical analyses. Discrete soil samples will be obtained from within the depth intervals shown in this column (rather than composite samples.) The depth ranges represent the intervals that a sample will be analyzed for the COPCs identified in the Soil Analyses columns. Additional samples may be analyzed if field observations indicate the presence of contamination.

[2] The metals listed; arsenic, cadmium and lead, represent metals that had concentrations exceeding screening levels in one or more locations. Some soil samples collected from the infrastructure corridor may also be analyzed for "RCRA 8" metals to provide data needed by soil disposal facilities. The RCRA metals include arsenic, barium, cadmium, chromium, lead, mercury, selenium & silver.

[3]TOC= total organic carbon. TOC and other physical soil properties such as grain size may also be analyzed at various locations for the possibility of establishing site specific Method B cleanup levels.

[a] Also analyze for EPH.
[b] Also analyze for total organic carbon
x = sample collected for analytical testing. Red X = additional analytical testing requested by Ecology in it's September 22, 2008 comment letter.
As = Arsenic, Cd = Cadmium, Pb = Lead
PCBs = Polychlorinated biphenyls
HCID = Hydrocarbon Identification test (NWTPH-HCID)
NWTPH-Dx = Diesel-range and motor oil-range total petroleum hydrocarbons
TPH-MO = motor oil-range petroleum hydrocarbons
D/F = Dioxins and furans
NWTPH-G = Gasoline-range total petroleum hydrocarbons

TABLE 2
PROPOSED NEW MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

				Existing Well Data[2]		
Well I.D.	**Purpose**	**Installation Method/Well Diameter**	**Proposed Well Screen Interval (BGS-feet)[1]**	**Nearest Existing well**	**Highest DTW**	**Lowest DTW**
MW21s	MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19.	Direct push/1-inch	2 to 7	MW19	3.47	3.78
MW22s	MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06.	Direct push/1-inch	1 to 6	MW6	0.84	1.14
MW23s	MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18.	Direct push/1-inch	4 to 9	MW16	5.41	6.35
MW24s	MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	Direct push/1-inch	2.5 to 7.5	MW10	3.48	3.8
MW25s	MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04	Direct push/1-inch	2 to 7	MW7 and MW8	5.0 & 2.55	5 & 2.62

Notes:

Based on recent comments from Ecology, because artesian wells at the Site may be influencing groundwater levels, an attempt will be made to locate and decommission the artesian wells. If the artesian wells are found and decommissioned, the need for shallow monitoring wells will be reevaluated.

[1]Across water table with one foot of screen above predicted high water table elevation and four feet of screen below this elevation, subject to approval by Ecology and issuance of well construction variance.

[2] Based on depth to water measurements collected August 2007 and July 2008 during low and high tides.

bgs=below ground surface

DTW = depth to water in feet as measured from top of well casing. Top of well casings for referenced wells is approximately at ground surface.

Seep 4 [10]	Groundwater/surface water interface													NA	x	x	x	x	x	x	x	--	--

Notes:

[1]Dissolved metals to be tested in addition to total metals at locations where metals exceedances have been measured. Also test these samples for aluminum and iron (Al and Fe^{3+}) to represent suspended clay particles. Results to potentially be used for evaluating sorption of COPCs.

[2]MW05, MW12, MW16 and MW18 are downgradient wells between the subject property and East Bay. These wells will be considered for potential future compliance wells.

[3]MW04, 05, 06, 07, 08, 10 were sampled and tested July 13, 2007 for diesel-range hydrocarbons only.

[4]MW01 through MW10 were installed in January 2007. MW11 through MW20 were installed in July and August 2007.

[5]MW14 was not sampled in 2007 because other monitoring wells surrounding MW14 were sampled and tested.

[6]Note on SVOCs. The only SVOC exceedances were cPAHs, therefore only cPAHs will be analyzed, rather than the full SVOC list.

[7]Note on PCBs. PCBs have not been detected in any of the groundwater samples obtained from MW01 through MW20 at the site; nor have they been detected above soil screening levels. Therefore PCBs will only be tested at locations where low level detections of PCBs were detected in soil on Parcel 3 and near the former transformer location (MW04).

[8]Note on Dioxins/Furans. Dioxin/Furans were not detected in a groundwater sample obtained and tested from MW16 in August 2008. Dioxin sampling and testing approach is based on obtaining samples from potential source area wells that are also downgradient compliance wells (MW05 and MW16). If dioxins/furans are detected in groundwater at MW05 or MW16, then additional testing will be conducted at the other compliance wells (MW04, MW11, MW12

[9]This well will not be installed if water levels drop sufficiently after the artesian wells are decommissioned if the existing paired monitoring well screen is not totally submerged.

[10]Water from this seep area will only be sampled if it is determined to represent groundwater (see Section 5.4.2 of Sample and Analysis Plan)

x = sample collected for analytical testing
Y = Yes; N = No; NA = not applicable; "--" = Not tested
TPH-Gasoline by Ecology Method NWTPH-Gx
TPH-Diesel and Oil by Ecology Method NWTPH-Dx
VOCs (volatile organic compounds) by EPA Method 8260B
RCRA Metals (As, Ba, Cd, Cr, Pb, Ag, Se, Hg) by EPA Methods 6000/7000
PAHs (polycyclic aromatic hydrocarbons) by EPA Method 8270sim
PCBs (polychlorinated biphenyls) by EPA Method 8082
Dioxins/Furans by EPA Method 1613B
ORP = Oxidation Reduction Potential
DO = Dissolved Oxygen
Fe = Iron
Al = Aluminum
COPCs = contaminants of potential concern

Subject: Data Gap Work Plan for the Soil-to-Indoor Air Pathway and Response to Comments for Ecology's March 14, 2013 Comments East Bay Redevelopment Site, Olympia, Washington Ecology Facility/Site No. 5785176, Agreed Order DE5471

Dear Mr. Teel:

On behalf of the Port of Olympia (Port), PIONEER Technologies Corporation (PIONEER) is enclosing two copies of the revised Data Gap Work Plan for the Soil-to-Indoor Pathway at the East Bay Redevelopment Site (Site) for your review and approval. The work plan incorporates the Washington State Department of Ecology (Ecology) comments provided in an October 31, 2012 letter and a February 28, 2013 letter, in accordance with the February 19, 2013 and March 12, 2013 response to comments (RTC) documents. All RTC documents are included in Attachment C of the work plan for reference.

The enclosed work plan was not revised to address the comments in your March 14, 2013 letter for the reasons presented in the associated RTC (see Attachment C of the work plan). If the event that you do not agree with the RTC for the March 14th comments, the Port would like to request an April meeting to quickly reach final resolution on the issue.

Respectfully,

Troy Bussey Jr., P.E. (WA, CA), L.G. (WA), L.HG. (WA)
Senior Professional Engineer

subject: Data Gap Work Plan for the Soil-to-Indoor Air Pathway at the East Bay Redevelopment Site, Agreed Order DE5471, Ecology Facility/Site No. 6785176

Dear Mr. Teel:

On behalf of the Port of Olympia (Port), PIONEER Technologies Corporation (PIONEER) has prepared for your review this work plan for soil gas, ambient air, and soil sampling and analyses at the East Bay Redevelopment Site (Site). The purpose of this proposed sampling is to supplement the evaluation of the potential soil-to-indoor air pathway for total petroleum hydrocarbons (TPH) in the gasoline range (TPH-G) (PIONEER 2012, Washington State Department of Ecology [Ecology] 2012).

1 Introduction

The approximately 15-acre Site is located in Olympia, Washington, on the southeast corner of the Port peninsula adjacent to East Bay of Budd Inlet. This Model Toxics Control Act (MTCA) Site is currently being addressed under Agreed Order DE5471. The soil-to-indoor air pathway, which addresses the potential migration of volatile constituents from subsurface soil to indoor air, is a pathway currently being considered at this Site. TPH-G is the only constituent that exceeds screening levels for this pathway, and there are only three samples where TPH-G exceeds its soil-to-indoor air screening level of 100 mg/kg (PIONEER 2012).[1] A detailed evaluation of the existing TPH-G data concluded that these TPH-G exceedances are not significantly higher than the MTCA default screening level, and as a result, further consideration of the soil-to-indoor air pathway is not necessary per Washington Administrative Code (WAC) 173-340-740(3)(b)(iii)(C) (PIONEER 2012). However, Ecology requested collection of additional data to further support this conclusion (Ecology 2012).

2 Description of Sampling and Analyses

Two sample locations (referred to as Soil Vapor Probe [SVP] SVP-1 and SVP-2) are proposed to further evaluate whether or not TPH-G concentrations in soil pose a potential concern for the soil-to-indoor air pathway at this Site. Soil gas samples will be collected at each sample location. A soil sample will also be collected from a co-located direct-push boring located adjacent to each SVP (e.g., offset approximately two feet) after the soil gas samples have been collected. Figure 1 presents the proposed sample locations relative to TPH-G soil screening level exceedances for the soil-to-indoor air pathway. Table 1 presents a summary of the details and rationale for each sampling location.

Although soil data are being collected to determine current TPH-G soil concentrations, soil gas is the primary media that will be used for a more detailed evaluation of the potential soil-to-indoor air pathway per Ecology guidance (Ecology 2009). In accordance with WAC 173-340-750(3)(b)(ii)(C), soil gas concentrations of benzene, toluene,

[1] In accordance with Washington Administrative Code (WAC) 173-340-740(3)(b)(iii)(C)(I), TPH-G screening levels are default concentrations derived for protection of groundwater for drinking water beneficial use under WAC 173-340-747(6).

ethylbenzene, and xylenes (BTEX) and other gasoline-related constituents will be used to evaluate the potential impacts associated with TPH-G in soil gas since there are no MTCA Method B air cleanup levels for TPH-G.

2.1 SOIL GAS SAMPLING

Each temporary SVP will be constructed using a Post Run Tubing (PRT) system (see Figure 2) installed by a Washington licensed driller. The driller will clean the PRT tip threads and seat daily (or more frequently if needed), and will change the PRT O-ring daily. Rods equipped with a PRT point holder and expendable drive point will be driven to a depth of greater than five feet below ground surface (bgs) so that the top of the drive point is at least five feet bgs. Before the rods are pulled back, rigid-walled, ¼-inch-diameter dedicated Teflon (or similar) tubing and a PRT adapter will be inserted down the rod bore and rotated to form a vacuum tight connection at the point holder. This results in a continuous run of tubing from the sample level to the surface. The top end of the system will be sealed with bentonite to minimize gas exchange with the ambient air. A leak test of the PRT tubing system will be conducted at this time by applying a vacuum to the tubing. An in-line gauge will be used to verify that leaks do not occur after the vacuum has been applied. The rods will then be retracted no more than six inches to provide an open cylinder in the soil through which the soil gas may be purged and sampled. The upper end of the tubing in the system will be connected to the sampling canister and the purging canister via a sampling/purging manifold provided by the laboratory. After installation of a given SVP, an equilibration period of at least 60 minutes shall be observed prior to any shut-in testing, leak testing, purging, and sampling.

Before a given soil gas sample is collected, two separate leak testing procedures will be performed to identify and address any leaks in the sampling/purging manifold: 1) a static shut-in test and 2) a tracer compound test. A static shut-in test will be performed to ensure the manifold fittings are securely sealed. Criterion for a satisfactory shut-in test is no decrease of vacuum in the purging canister over a one minute period. Fittings will be reassembled and/or tightened as necessary until the shut-in test criterion is met. The tracer compound test will be performed during purging to quantitatively assess potential leaks of ambient air in the SVP sampling train. For the tracer compound test, the immediate area surrounding the PRT System will be covered in a 6-mil plastic sheet (at least 10x10-foot area) flush to the ground. Then, a large shroud/glove box will be installed over the SVP, sampling/purging manifold, purging canister, and sampling canister. The shroud/glove box will be sealed to the ground surface using duct tape, hydrated bentonite, and/or a non-volatile organic compound (VOC) sealant (e.g., Sikaflex®), and will remain in place for the duration of purging and sampling (see Figure 3). Helium trace gas will be injected into the shroud/glove box. The helium concentration in both the shroud/glove box and in the sampling train will be quantitatively measured in the field. The criterion for a satisfactory tracer compound test is a helium concentration in the sampling train that does not exceed five percent of the helium concentration in the shroud/glove box. System leaks will be remedied as appropriate until the tracer compound test criterion is met. In addition to the leak tests, at least three sampling train volumes of air will be purged through the sampling/purging manifold with a purging canister (provided by the laboratory) prior to sample collection.

Once the shut-in test and tracer compound test are satisfactorily completed and the sampling train has been adequately purged, soil gas samples will be collected from SVP-1 and SVP-2. The samples will be collected using a 1-liter Summa canister and a laboratory-supplied regulator set for a flow rate between 100-200 milliliters per minute. Probe vacuum during sampling will be less than 100 inches of water (8 inches of mercury). Sampling will stop when the remaining canister vacuum gauge is approximately three to five inches of mercury. The final canister vacuum will be recorded on the chain-of-custody.

2.1.1 Soil Gas Field Quality Control

One field duplicate soil gas sample per sampling event will be collected using a T-splitter at the point of sample collection. One equipment blank per sampling event will be collected after the soil gas samples are collected. The

equipment blank sample will be collected by connecting a Summa canister and clean tubing to the cleaned, non-dedicated PRT equipment after the PRT equipment is placed on the ground surface in a non-impacted location.

2.2 AMBIENT AIR SAMPLING

In order to estimate ambient air background concentrations during the sampling period, an upwind ambient air sample will be collected as synoptically as possible with the soil gas samples. The intake for the ambient air sample will be positioned at breathing height (i.e., approximately five feet above ground surface). The wind direction will be determined either by observations immediately prior to sample collection and/or a wind rose generated using wind direction and magnitude readings over the past year from a nearby meteorological station. The ambient air sample will be collected using a 1-liter Summa canister and a laboratory-supplied regulator set for a flow rate between 100-200 milliliters per minute. Sampling will stop when the remaining canister vacuum gauge is approximately three to five inches of mercury. The final canister vacuum will be recorded on the chain-of-custody.

2.3 SOIL SAMPLING

After soil gas and ambient air sampling, a co-located direct-push boring will be advanced to a depth of approximately six feet bgs adjacent to each SVP location (e.g., offset approximately two feet). As shown in Table 1, a soil sample will be collected from the direct-push boring at the same depth interval as the previous TPH-G screening level exceedance in that location. Soil samples will be collected using United States Environmental Protection Agency (USEPA) Method SW846-5035.

Field guidelines and descriptions of procedures applicable to soil sampling at the Site are included in the Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP) provided as Attachment A. The SAP/QAPP is Appendix D of the Remedial Investigation Work Plan for the East Bay Redevelopment Site (GeoEngineers and Pioneer 2008). Deviations from this SAP/QAPP are described in Table 2. Field activities will be documented using PIONEER field forms provided as Attachment B.

2.4 SAMPLE BORING DECOMISSIONING

Once soil gas and soil samples have been collected, the driller will decommission all SVP and soil sample borings by backfilling the boreholes with bentonite chips and hydrating the bentonite chips.

2.5 ANALYSES

All soil gas and ambient air samples will be analyzed for BTEX, 1,2,4-trimethylbenzene, 1,3,5 trimethylbenzene, n-hexane, 1,2-dibromoethane, 1,2-dichloroethane, methyl tertiary-butyl ether and naphthalene using USEPA Method TO-15. All soil gas and ambient air samples will also be analyzed for oxygen, carbon dioxide, methane, nitrogen, and helium using American Society of Testing and Materials (ASTM) Method D1946. Target reporting limits for these soil gas and ambient air analyses are presented in Table 3. Table 4 presents the appropriate sample containers and holding times for the soil gas and ambient air analyses. Sample containers will be provided by the analytical laboratory and each canister will be individually certified clean by the laboratory to the target reporting limits. Prior to field mobilization, the initial canister vacuums measured by the laboratory will be verified to ensure that they have a vacuum of approximately 30-inches of mercury. Canisters with an initial vacuum of less than 25 inches of mercury will be returned to the laboratory for a replacement canister.

It is anticipated that soil gas and ambient air analysis will be performed by Eurofins Air Toxics, Inc. (Air Toxics), which is an Ecology accredited laboratory for these analyses. It is expected at a minimum that Air Toxics will perform and report the following laboratory quality control analyses once per batch of soil gas/ambient air samples for select

constituents (the standard USEPA Contract Laboratory Program constituents): method blank, blank spike, matrix spike, and matrix spike duplicate. It is also expected that the laboratory will perform and report results of surrogate recovery for every sample. Expectations for laboratory control limits are shown in Table 5.

All soil samples will be analyzed for TPH-G using Ecology Method NWTPH-G and for BTEX, 1,2,4-trimethylbenzene, 1,3,5 trimethylbenzene, n-hexane, 1,2-dibromoethane, 1,2-dichloroethane, methyl tertiary-butyl ether and naphthalene using USEPA Method SW846-8260B. It is anticipated that soil analyses will be performed by Anatek Labs, which is an Ecology accredited laboratory for these analyses. Quality control procedures for soil analyses will be in accordance with the SAP/QAPP provided in Attachment A. Target reporting limits for these soil analyses are presented in Table 3.

3 Schedule

Following review and approval of this Work Plan by Ecology, PIONEER will collect the samples once the weather conditions are sufficiently dry to prevent collecting soil gas samples when the vadose zone pores are saturated. Specifically, soil gas samples will not be collected if (1) ponded water on the ground surface is present within 20 feet of a SVP, or (2) it has been less than 48 hours since it rained more than a ½-inch in a 24 hour period. PIONEER will notify Ecology 48-hours prior to starting the field work.

Notes:

[(1)] These gasoline-related constituents will be used to evaluate the potential impacts associated with TPH-G soil gas since there are no MTCA Method B air cleanup levels for TPH-G.

Table 2: Sampling Deviations from the Sampling and Analysis Plan/Quality Assurance Project Plan

SAP/QAPP Section	Deviation	Rationale/Explanation
4.0	Work will be executed by PIONEER rather than GeoEngineers.	The Port of Olympia selected PIONEER to perform this work.
2.0	Soil sample will not be collected every two feet.	Table 1 describes the depth intervals that will be sampled.
2.0	Water sheen and headspace vapor screening methods will not be used.	Due to the nature of sampling being conducted per this Work Plan, these tests will not be employed.
2.0	Investigation derived waste will be handled differently.	It is anticipated based on previous sampling events that an insignificant volume of decontamination water will be generated and therefore will be discharged on site. It is anticipated based on previous sampling events that an insignificant volumed of unused soil cores will be generated. These soils will be placed on-site.
5.2	Soil samples will not be collected in four-to-six inch intervals	Soil samples will be collected at the same depth interval as nearby TPH-G exceedances.
5.2	A different GPS unit will be used.	PIONEER has a different GPS unit (which is more accurate than the unit specified in the SAP/QAPP).
8.0	Sample nomenclature will be revised.	To improve data usability during subsequent data evaluations.
Table 4	Different target reporting limits will be used.	Reporting limits for the analytical methods and anticipated laboratories are presented in Table 3.

Notes:

Notes:

N/A : not applicable

NC: not calculated in the previous screening evaluation. Screening levels will be calculated as necessary for detected constituents.

Screening levels are presented as two significant figures, except values greater than 100 are rounded to the nearest whole number.

[1] From the Screening Evaluation of the Potential Soil-to-Indoor Air Pathway for the East Bay Redevelopment Site Memorandum (PIONEER 2012).

[2] From Table B-1 of the Guidance for Evaluating Soil Vapor Intrustion in Washington State (Ecology 2009).

[3] Soil gas data for gasoline-related constituents will be used to evaluate the potential impacts associated with TPH-G soil gas since there are no MTCA Method B air cleanup levels for TPH-G.

[4] Due to its low vapor pressure, naphthalene may exceed TO-15 performance requirements.

[5] Although these target reporting limits (RLs) exceed the screening levels (SLs) for unrestricted land use, these are the lowest possible target RLs with TO-15. Although TO-15 select ion monitoring (SIM) could achieve lower target RLs (note that target RLs for 1,2-dibromomethane using TO-15 SIM would still exceed its unrestricted SL), TO-15 SIM requires a 6-liter Summa canister. An Ecology comment on this work plan required the use of 1-liter Summa canisters. If SLs based on a default attenuation factor of 0.1 are used to evaluate the soil gas data rather than SLs calculated with the Johnson and Ettinger model, the SLs for these constituents will be adjusted up to the actual RL in accordance with WAC 173-340-750(5)(c).

Table 4: Soil Gas Sample Containers, Preservation, and Holding Times

Constitutents	Media	Analytical Method	Sample Container	Preservative	Extraction Holding Time (days)	Analysis Holding Time (days)

SAMPLING AND ANALYSIS PLAN AND QUALITY ASSURANCE PROJECT PLAN REMEDIAL INVESTIGATION WORK PLAN EAST BAY REDEVELOPMENT, PORT OF OLYMPIA OLYMPIA, WASHINGTON FOR PORT OF OLYMPIA

1.0 INTRODUCTION

This Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP) describe sample collection, handling and analysis procedures associated with the Remedial Investigation Work Plan (RIWP) for the Port of Olympia's (Port) 13-acre East Bay Redevelopment Site (Site). The Site is located in Olympia, Washington, as shown in Figure 1. This SAP must be used in conjunction with the RIWP and the project-specific Health and Safety Plan (HASP).

Detailed descriptions of the field sampling procedures are provided in this document. Site conditions may make it necessary to modify these procedures. Any variations or modifications that become necessary during the investigation will be coordinated with Port personnel, the Washington State Department of Ecology (Ecology) and other involved parties, as appropriate. Variations or modifications implemented during the investigation and the reason for the modification will be documented in field records.

This SAP describes field activities, sampling equipment, sampling locations and procedures that will be used during investigations at the Site. This SAP also includes a QAPP (Section 11), which identifies quality assurance/quality control (QA/QC) procedures that will be implemented during field sampling activities and laboratory analyses.

2.0 PURPOSE AND SCOPE

The purpose of this SAP is to present the detailed procedures that will be used to obtain samples during the supplemental remedial investigation (RI). The objective of this sampling is to provide information to:

- Characterize the nature and extent of contamination at the Site;
- Assess the potential risk to human and ecological receptors; and
- Provide the information that will allow selection of cleanup action alternatives.

Rationale for sample locations and depths and monitoring wells are described in Tables 1 through 3.

Activities to be performed by GeoEngineers during the RI include the following:

1. Update the Project HASP and SAP for use by GeoEngineers' personnel during the RI.
2. Retain public and private utility locating services to identify and locate underground utilities in the exploration areas in coordination with the Port.
3. Retain a concrete coring contractor to core through paved surfaces, as necessary.
4. Monitor the advancement of soil explorations using direct-push and/or hollow-stem auger techniques to depths specific to proposed sample locations. If field screening indicates

contamination is present at the target total depth for a boring, the boring will be advanced until field screening indicates contamination is not present.

a. Soil borings will be located by measuring from known previously surveyed features (roads, existing monitoring wells, etc) and GPS readings.

b. Samples of soil will be collected continuously for the total depth of each boring. Samples for potential chemical analyses will be collected approximately every two feet. Soil will be visually classified in the field according to the Unified Soil Classification System. Contacts between soil lithologies and fill episodes, if feasible, will also be described.

c. Groundwater monitoring wells may be constructed in five borings as described in Table 2.

5. Obtain soil samples as specified in this SAP and the RIWP. Field screening will be performed on each sample using visual, water sheen and headspace vapor screening methods. The field screening results will be used as a general guideline to approximate the vertical extent of petroleum-related contamination in the soil samples. In addition, screening results will be used to aid in the selection of soil samples to be submitted for chemical analysis.

6. Explore the locations and nature of water seeps along the shoreline embankment and collect data to determine if the seeps represent groundwater.

7. Obtain groundwater samples from existing and new monitoring wells for chemical analytical testing using low-flow sampling methodology. Measure depth to water using an electric water level indicator.

a. Collect water samples from seeps if the seeps represent groundwater.

8. Contain soil cuttings, purge water and decontamination water in steel drums and store the drums in a secure location designated by the Port to await off-site transport and disposal. The drums will be labeled according to standard GeoEngineers' practice.

9. Submit soil and groundwater samples to a subcontracted chemical analytical laboratory for chemical analysis. The chemical constituents for each sample have been determined based on existing data and assumptions of the chemicals of potential concern (COPCs) present. Sample locations, depth intervals, and COPCs are described in Tables 1 through 3. The chemical analysis may include one or more of the following:

a. Gasoline-, diesel- and motor oil-range petroleum hydrocarbons by Ecology Methods NWTPH-Gx and NWTPH-Dx,

b. Metals by U.S. Environmental Protection Agency (EPA) Method 6000/7000 series,

c. Volatile organic compounds (VOCs) by EPA Method 8260B,

d. Semivolatile organic compounds (SVOCs) including carcinogenic polycyclic aromatic hydrocarbons (cPAHs) by EPA Method 8270 SIM,

e. Polychlorinated biphenyls (PCBs) by EPA Method 8082, and

f. Dioxins/furans by EPA Method 1613B or Method 8290.

Tables 4 and 5 summarizes the target analytical reporting limits and analytical methods that will be used for soil and groundwater.

10. Document sample methodology and sample locations using detailed field logs.

11. Use database and geographic information system (GIS) technologies to manage chemical analytical data and sample locations.

3.0 PROJECT SCHEDULE

Field work for the supplemental RI will be conducted in phases. The initial phase of the RI will be completed in Fall 2008 in order to provide data critical to the planning of the infrastructure improvement project. The initial phase includes completing eight explorations located in or near the infrastructure corridor. The initial eight exploration locations include borings DP27, DP30, DP32, DP33, DP34, DP36, DP38, and DP40, which are also highlighted on Table 1. The initial phase will also include locating suspected artesian wells, as described in Appendix B of the RI Workplan. Subsequent phase of field work will be completed after data from the first phase has been evaluated and after decommissioning of the artesian wells.

4.0 ROLES AND RESPONSIBILITIES

This section outlines the individuals directly involved with the RI. Work performed under this SAP will be in cooperation with the Port.

Key personnel for this project are as follows:

Position	Name	Affiliation	Telephone Number
Ecology Project Coordinator	Steve Teel	Washington State Department of Ecology	360-407-6247
Port Project Coordinator	Joanne Snarski	Port of Olympia	360-528-8061
Principal-in-Charge	David Cook	GeoEngineers, Inc.	206-728-2674
Project Manager	Jay Lucas	GeoEngineers, Inc.	206-239-3221

- The **Ecology Project Coordinator** is responsible for providing timely technical review and guidance regarding compliance with the Agreed Order (AO) and is responsible for overseeing implementation of the AO for Ecology.
- The **Port Project Coordinator** is responsible for administering the contract with the consultant and is responsible under the AO for overseeing implementation of the AO for the Port.
- The **Principal-in-Charge** works with the Project Manager and is responsible for project document QA/QC review.
- The **Project Manager** reports directly to the Port Project Coordinator and the Principal-in-Charge. The Project Manager is responsible for coordinating project activities and submitting deliverables to the Port. The Project Manager's duties consist of providing concise technical work statements for project tasks, selecting project team members, determining the degree of subcontractor participation, establishing and adhering to budget and schedule, providing technical oversight and providing review of all work.

5.0 FIELD PROCEDURES

The rationale, depths and chemical program for soil and groundwater samples are presented in Tables 1 through 6 of this SAP and are described in the RIWP. The soil and groundwater samples will be obtained and submitted to a Washington State accredited laboratory for chemical analysis.

Note that Sampling and Testing associated with the RI, as outlined in this SAP, includes a phased approach to facilitate early decisions regarding the infrastructure improvements and associated excavation. The phased explorations and testing approach are highlighted in Table 1 of this SAP.

5.1 UNDERGROUND UTILITY LOCATE

Prior to sampling activities, an underground utility locate will be conducted in the area of the proposed sample locations to identify any subsurface utilities and/or potential underground physical hazards.

5.2 SUBSURFACE SOIL SAMPLING

5.2.1 Sample Collection Method

Subsurface soil sampling will be conducted using a direct-push drilling rig equipped with a core barrel lined with disposable acetate sleeves. Soil samples will be obtained every two feet for potential chemical analytical testing and field screening, as described in Table 1. Samples obtained for chemical analytical testing will consist of approximately four- to six-inches of the soil core. The depth of each sample will be measured from the bottom of the sample interval. The depth to the groundwater table, if present, may also be measured at each sample location, using an electric water level indicator.

Samples to be analyzed for gasoline-range petroleum hydrocarbons and VOC analysis following EPA Method 5035A (Ecology 2004) will be obtained first. Samples obtained for non-volatile analyses will be obtained from the same general intervals as the volatile samples. Planned sample depths are based on results from earlier studies and are outlined in Table 1. Sample containers will be labeled in the field and stored in an iced cooler prior to and during shipment to the chemical analytical laboratory.

Sampling activities will be conducted by a GeoEngineers representative, and soil will be visually classified in the field according to the Unified Soil Classification System (USCS) and American Society for Testing and Materials (ASTM) Standard 2488.

Field personnel will record the sample locations using hand-held Trimble GeoXT global positioning system (GPS) units with sub-meter accuracy during sampling activities. Sub-meter accuracy standards will be used during data collection to record latitude and longitudinal data. A minimum of four satellites will be required for a position dilution of precision (PDOP) value of less than 6. Satellite elevation must be at least 15 degrees above the horizon, with a minimum signal-to-noise ratio (SNR) of 39 bBHz. GPS data collected in the field will be subsequently processed in the office using measurements from the nearest reference station to each collection point.

5.2.2 Sample Locations

Twenty-two new boring locations are planned and shown in Figures 2 and 3. The borings are placed in areas to further evaluate the lateral and/or vertical extent of contamination that has been identified in previous studies. The rationale for sample locations and depth intervals are described in Table 1.

5.2.3 Phase 1: Infrastructure Construction Corridor Sample Locations

Locations of eight borings are within utility corridors associated with the infrastructure improvements. These borings may be completed during an initial phase of exploration to accommodate the construction schedule. These borings are highlighted in Table 1 and Figure 2. Sampling in the infrastructure corridor will provide data to characterize soil that will be removed during excavation activities.

5.3 FIELD SCREENING

Field screening for evidence of possible contamination will be performed on soil samples obtained from the explorations. Field screening results will be recorded on the field logs, and the results will be used as a general guideline to delineate areas of possible contamination. Screening results will be used to aid in the selection of soil samples to be submitted for chemical analysis. The following screening methods will be used: (1) visual screening, (2) water sheen screening and (3) headspace vapor screening. Visual screening and water sheen screening are qualitative methods; therefore, precision, accuracy and detection limits are not quantified for these methods. Headspace vapor screening is a semi-quantitative method; however, precision and accuracy will not be quantified for this method. Instrument accuracy and detection limits are described below. Field screening results are site- and location-specific. The results may vary with temperature, moisture content, soil type and chemical constituent.

5.3.1 Visual Screening

The soil will be observed for unusual color and stains and/or odor indicative of possible contamination.

5.3.2 Water Sheen Screening

A portion of the soil sample will be placed in a pan containing distilled water. The water surface will be observed for signs of sheen. The following sheen classifications will be used:

Classification	Identifier	Description
No Sheen	(NS)	No visible sheen on the water surface
Slight Sheen	(SS)	Light, colorless, dull sheen; spread is irregular, not rapid; sheen dissipates rapidly
Moderate Sheen	(MS)	Light to heavy sheen; may have some color/iridescence; spread is irregular to flowing, may be rapid; few remaining areas of no sheen on the water surface
Heavy Sheen	(HS)	Heavy sheen with color/iridescence; spread is rapid; entire water surface may be covered with sheen

5.3.3 Headspace Vapor Screening

Headspace vapor screening will be performed on a portion of the soil sample placed into a resealable plastic bag. Ambient air will be captured in the bag; the bag will be sealed and then shaken gently to expose the soil to the air trapped in the bag. The bag will remain closed for approximately 5 minutes at ambient temperature before the headspace vapors are measured. Vapors present within the sample bag's headspace will be measured by inserting the probe of a photoionization detector (PID) through a small opening in the bag. A PID measures the concentration of organic vapors ionizable by a 10.6 electron volt (eV) lamp in parts per million (ppm) and quantifies organic vapor concentrations in the range between 0.1 ppm and 2,000 ppm (isobutylene equivalent) with an accuracy of 1 ppm between 0 ppm and 100 ppm. The maximum value on the instrument and the ambient air temperature will be recorded on the field log for each sample. The PID will be calibrated to 100 ppm isobutylene.

5.4 GROUNDWATER SAMPLING

5.4.1 Monitoring wells

Groundwater will be sampled from 17 existing and new monitoring wells for chemical analytical testing as shown in Table 3. Monitoring wells will be sampled using low-flow sampling methodologies, as described below.

- Prior to sampling, measure depth to water with an electric water level indicator.
- Purge groundwater from the monitoring wells using dedicated tubing, a peristaltic pump (or equivalent), a flow-through cell and water parameter analyzer (Horiba U-20). Purge monitoring wells using a flow rate between 100 and 500 milliliters per minute (mL/min) that does not create significant drawdown in the well. When field parameters have stabilized or at least three well volumes of water have been purged from the well, disconnect the flow-through cell and sample groundwater directly from down-well tubing, maintaining a low-flow pumping rate. Water quality parameters to be monitored during purging include: conductivity, dissolved oxygen, pH, salinity, total dissolved solids, turbidity, oxidation-reduction potential and temperature.
- Place each groundwater sample directly into a laboratory-prepared sample container, label the container, log the sample on the chain-of-custody and sample collection form, and place the container into a cooler with ice.

5.4.2 Groundwater Seeps

Greylock Consulting identified four seep locations along the shoreline during a low tide on July 16, 2008. These locations, as well as other seep locations that may be identified during site visits, will be evaluated to determine if they represent groundwater rather than surface water, irrigation water or discharge from buried pipes.

The evaluation will be based on several lines of evidence that will include:

- Physical observations of the proximity of the seeps to known utilities that could represent areas where water leaks from stormwater drains or from the fill around buried utilities.
- Explore the soil above the seeps to determine if the soil is saturated above the seepage point, and follow the saturation to its point of origin. This exploration will be conducted with hand digging equipment.
- Measure the temperature, salinity and conductivity of the water discharging from the seeps and compare these values to that representative of groundwater and of marine water. This will help determine if the seeps represent delayed drainage of sea water, rather than groundwater.
- Determine if the seeps originate at a higher elevation that the groundwater table. If a seep originates above the elevation of the groundwater table or high tide elevation that day, it is evidence that the seep does not represent groundwater. The elevation of the groundwater table will be based on water levels measured in the nearest monitoring well during the high tide and the low tide of that day's tidal cycle.

If water from an area of seepage is identified as groundwater, a representative sample will be collected for chemical testing as identified in Table 3. The sample will be collected by pushing a short PVC pipe into the seep so the water drains from the end of the pipe. Following insertion of the PVC pipe, a sample of the water will be collected after turbidity caused by the initial disturbance has descreased. Conductivity, temperature, and salinity water quality parameters will be measured as described above for the monitoring well samples. Up to four samples representative of groundwater seeps will be collected. The PVC pipe will be decontaminated prior to collection of each sample.

5.5 FIELD EQUIPMENT CALIBRATION PROCEDURES

Field equipment requiring calibration will be calibrated to known standards in accordance with manufacturers' recommended schedules and procedures for each instrument. If field equipment becomes inoperable, it will be replaced with a properly calibrated instrument.

6.0 CHEMICAL ANALYTICAL PROGRAM

All samples will be submitted to a Washington State accredited laboratory. Tables 1 and 3 summarize the chemical analyses for soil and groundwater samples from monitoring wells, respectively. Tables 4 and 5 summarize the target analytical reporting limits.

7.0 SAMPLE HANDLING AND CUSTODY REQUIREMENTS

The following procedures will be used when obtaining soil and/or groundwater samples during the investigation activities.

- Dedicated nitrile gloves will be worn when obtaining each sample, including quality control (QC) samples.
- Soil samples obtained for chemical analysis of gasoline-range petroleum hydrocarbons and VOCs will be obtained using EPA Method 5035A.
- Samples obtained for chemical analysis will be transferred into clean sample containers supplied by the analytical laboratory. Table 6 lists the sample containers to be used.
- Sufficient sample volume will be obtained for the laboratory to complete the method-specific QC analyses on a laboratory-batch basis.
- Sample labels will be completed for each sample following the procedures provided in this section. Immediately after the samples are obtained, they will be stored in a cooler with ice until they are delivered to the analytical laboratory.
- Standard chain-of-custody procedures will be followed for all samples obtained.

7.1 CUSTODY SEALS

Custody seals are signed and dated seals that are affixed to the lid of a shipping container (for example, cooler) and are used to indicate if the container has been opened before it reaches the intended recipient. Custody seals will be attached to containers by GeoEngineers personnel before they are transferred to the chemical analytical laboratory.

7.2 CUSTODY PROCEDURES

Chain-of-custody procedures will be used to track the possession of the samples from the time they are obtained in the field through analysis and final disposition. Each time the samples change hands, both the sender and receiver will sign and date the chain-of-custody record form. A chain-of-custody record form will be used to track possession of the samples and to document the analyses requested. The form will be completed at the end of each sampling day prior to transfer of samples off-site and will accompany the samples during transfer to the laboratory.

When the samples are shipped to the laboratory via common carrier, one copy of the chain-of-custody record form will be retained for project files, and the remaining copies will be enclosed in a plastic bag and secured to the inside of the cooler prior to shipment.

Upon receipt of the samples at the laboratory, the custody seals will be broken, the chain-of-custody form will be signed as received by the laboratory, and the conditions of the samples will be recorded on the form. The original chain-of-custody form will remain with the laboratory, and copies will be returned to the relinquishing party.

8.0 DOCUMENTATION OF FIELD ACTIVITIES

Daily field activities, including observations and field procedures, will be recorded on appropriate forms. The original field forms will be maintained in GeoEngineers' office files. Copies of the completed forms will be maintained in a sequentially numbered field file for reference during field activities. Photographic documentation of field activities will be performed as appropriate.

8.1 SAMPLE DESIGNATION

Each sample obtained during field activities will be identified by a unique sample designation. The sample designation will be included on the sample label. For soil samples, the designation also will be included with the corresponding sample information on the appropriate field log. For groundwater sampling from monitoring wells, the corresponding sample information will be recorded on the monitoring well sampling field sheet. The following sample designation system will be used for this project.

All samples will be assigned a unique identification code based on a consistent sample designation scheme. The sample designation scheme is designed to suit the needs of the field staff, data management and data users. All samples will consist of three components separated by a dash. These components are station code, date and sample interval. The sample designation scheme is as follows:

Station Code	Date	Sample Interval
SSnn	YYMMDD	XXX
MWnn	YYMMDD	W

The three components are described below.

8.1.1 Station Code

The station code component is a four-character code that uniquely identifies each sampling station. The station code component has two parts: a two-letter station designation ("SS" or "MW") followed by a sequential two-digit number component "nn." The two-letter "SS" designation will be determined by how the soil sample was obtained (for example, drilling method, grab) as described below. The sequential "nn" component will begin at 26 (that is, 26, 27, 28) to accommodate samples previously obtained at the Site during previous studies. For groundwater samples, the "MWnn" designation will correspond to the monitoring well number (for example, MW25S).

The station designations are:

- DP – Direct-Push
- SB – Soil Boring using Hollow-Stem Auger (HSA) Drilling Techniques
- TP – Test Pit
- GB – Grab Sample

8.1.2 Date

The date component is a six-character code that presents the date that the sample was obtained in the following format: year, month, day (YYMMDD).

8.1.3 Sample Interval

The sample interval component corresponds to sample depth for soil samples, and is a three-character code that identifies each sampling interval. Soil sample depth determinations will be made to the nearest 0.5 foot, with the depth determination representing *either* the sample collection point (for VOC) *or* the beginning of the sampling interval (that is, 050 will represent the 5- to 5.5-foot interval). For groundwater, a "W" will be used for the sample interval component.

8.1.3.1 Field Quality Control (QC) Samples

Field QC samples will be identified by adding characters to the end of the sample interval field. The following characters are associated with the following field QC sample types:

- TB – VOC trip blank
- DUP – duplicate sample

8.1.4 Examples

Examples of complete sample numbers with descriptions are as follows:

- DP30-080825-020 A field sample collected at station DP30 on August 25, 2008, from 2 to 2.5 feet bgs.
- MW04-080825-W A groundwater sample collected at monitoring well MW04 on August 25, 2008.

Under the sample designation method described above, the identifier will be unique (that is, no two samples will have the same identifier) and informative (that is, location, date and sample interval). This designation scheme will facilitate overall data management and submittal into Ecology's Environmental Information Management (EIM) database.

8.2 SAMPLE LABELING

Sample information will be printed legibly onto the sample labels in indelible ink. Field identification will be sufficient to enable cross-reference with the project logbook.

To minimize handling of sample containers, labels will be completed before sample collection to the extent possible. The label will be filled out completely in the field and attached firmly to the sample container. The sample label will provide the following information:

- GeoEngineers' job number
- Sample designation
- Date of sample collection (month/day/year)
- Time of sample collection (hours: minutes)
- Chemical analyses to be conducted

- Sample preservation, if applicable
- Initials of sampler

8.3 FIELD LOGBOOKS AND DATA FORMS

Field logbooks (or daily logs) and data forms are necessary to document daily activities and observations. Documentation will be sufficient to enable participants to reconstruct events that occurred during the project accurately and objectively at a later time. All entries will be written in ink, dated and signed daily. No pages will be removed from logbooks for any reason. If corrections are necessary, these corrections will be made by drawing a single line through the original entry (so that the original entry is legible) and writing the corrected entry alongside. The correction will be initialed and dated. Corrected errors may require a footnote explaining the correction.

8.4 PHOTOGRAPHS

Documentation of a photograph is crucial to its validity as a representation of an existing situation. The following information will be noted in the field logbook or data forms concerning photographs:

- Date, time and location where photograph was taken
- Photographer
- Description of photograph taken
- Sequential number of the photograph and the film roll number, or sequence in the digital log
- Compass direction

9.0 DECONTAMINATION PROCEDURES

The objectives of decontamination procedures are to minimize the potential for cross-contamination between individual samples, to prevent contamination from leaving the sampling site by way of equipment or personnel and to prevent exposure of field personnel to contaminated materials. This section discusses general decontamination procedures.

9.1 PERSONNEL

Personnel decontamination procedures depend on the level of protection specified for a given activity. The HASP identifies the appropriate level of protection for each type of fieldwork involved in this project, as well as appropriate decontamination procedures.

9.2 SAMPLING EQUIPMENT

Decontamination procedures are designed to remove trace-level contaminants from sampling equipment to prevent cross-contamination of samples. Non-dedicated sampling or measurement equipment, including stainless steel sampling tools, soil sampling equipment and water level measurement instruments, will be decontaminated prior to and after each sampling attempt or measurement by washing with a nonphosphate detergent solution (for example, LiquiNox® and distilled water) and rinsing with distilled water.

10.0 INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW) generated from the subsurface investigations will be contained in 55-gallon steel drums and temporarily stored in a secured location as designated by the Port. The IDW is

anticipated to consist of soil cuttings, decontamination water, monitoring well development and purge water. The IDW will be separated by media (that is, soil and water) and labeled appropriately. Chemical analytical results from soil and groundwater sample analyses may be used to profile IDW for disposal at an appropriate off-site disposal facility. Solid waste from sampling activities (used gloves, tubing, etc.) will be contained in plastic trash bags and disposed as solid waste.

11.0 QUALITY ASSURANCE PROJECT PLAN

11.1 QUALITY ASSURANCE OBJECTIVES

The general quality assurance (QA) objectives for this project are to develop and implement procedures for obtaining and evaluating data of a specified quality that can be used to assess site conditions and risks. Field QA procedures to be followed include completing all appropriate sample documentation. Measurement data should have an appropriate degree of accuracy and reproducibility; samples obtained should be representative of actual field conditions, and samples should be obtained and analyzed using proper chain-of-custody procedures.

11.2 FIELD QA/QC PROCEDURES

Field QA/QC procedures to be followed include completing all appropriate sample documentation and preservation. One trip blank will be placed in each sample shipping container (for example, cooler) and analyzed for VOCs.

11.2.1 Trip Blanks

The analytical results of field trip blanks will be reviewed to evaluate the possibility for contamination resulting from the laboratory-prepared sample containers or the sample transport containers. Trip blanks will be analyzed at a frequency of one for each shipment of samples containing field samples for chemical analysis of VOCs. The trip blanks will be labeled with a "TB" sample identifier as described earlier in the "Sample Designation" section (Section 8.1) and delivered to the laboratory with the normal shipment of samples.

11.2.2 Sample Preservation and Containers

Samples will be kept in a cooler with ice before and during transport to the laboratory. The sampling extraction and analysis dates will be reviewed to confirm that extraction and analyses were completed within the recommended holding times, as specified by EPA protocol. Appropriate laboratory-assigned data qualifiers will be noted if holding times are exceeded or containers do not contain the appropriate sample preservation. Table 6 summarizes sample preservation and containers.

11.3 LABORATORY QA/QC PROCEDURES

The data quality objectives will be met in the laboratory by using established instrument calibration and sample handling procedures, analysis according to standard analytical methods and analysis of quality control samples. Laboratory quality control will consist of analysis of surrogate spikes, method blanks, duplicates, matrix spikes and matrix spike duplicates and reporting of all data including holding times.

11.3.1 Equipment Calibration Procedures and Frequency

All instruments and equipment used by the laboratory will be operated, calibrated and maintained according to manufacturer's guidelines and recommendations. Operation, calibration and maintenance

will be performed by personnel who have been properly trained in these procedures. A routine schedule and record of instrument calibration and maintenance will be kept on file at the laboratory.

11.3.2 Analytical Procedures

Samples will be analyzed according to analytical methods listed in Tables 1, 3, 4 and 5. EPA standard analytical methods are specified in *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW-846* (through update III), dated December 1996. Washington analytical methods for petroleum hydrocarbons are specified in the Model Toxics Control Act (MTCA) regulations, as outlined in Washington Administrative Code (WAC) 173-340.

11.3.3 Laboratory QA/QC Samples

Laboratory QC samples will be analyzed at a frequency of 5 percent (1 in 20) on a laboratory batch basis. Laboratory QC samples will consist of duplicates, method blanks, matrix spikes and matrix spike duplicates. In addition, each organic analysis will include addition of surrogate compounds to the sample for surrogate spike analysis.

11.3.4 Laboratory Deliverables

The following information will be provided in the laboratory reports submitted for this project:

- Transmittal letter, including information about the receipt of samples, the testing methodology performed, any deviations from the required procedures, any problems encountered in the analysis of the samples, any problems meeting the method holding times or laboratory control limits, and any corrective actions taken by the laboratory relative to the quality of the data contained in the report.
- Sample analytical results, including sampling date, date of sample extraction or preparation, date of sample analysis, dilution factors and test method identification; soil sample results in milligrams per kilogram (mg/kg), micrograms per kilogram (µg/kg) or nanograms per kilogram (ng/kg); and detection limits for undetected analytes. Results will be reported for all field samples, including field duplicates and blanks submitted for analysis.
- Method blank results, including reporting limits for undetected analytes.
- Surrogate recovery results and corresponding control limits for samples and method blanks (organic analyses only).
- Matrix spike/matrix spike duplicate and/or blank spike/blank spike duplicate spike concentrations, percent recoveries, relative percent differences and corresponding control limits.
- Laboratory duplicate results for inorganic analyses, including relative percent differences and corresponding control limits.
- Sample chain-of-custody documentation.

The raw analytical data, including calibration curves, instrument calibration data, data calculation work sheets and other laboratory support data for samples from this project, will be compiled and kept on file at the laboratory's office for reference.

11.4 REVIEW OF FIELD AND LABORATORY QA/QC DATA

The sample data, field and laboratory QA/QC results will be evaluated for acceptability with respect to the RI data quality objectives (DQOs). Each group of samples will be compared with the DQOs and

evaluated using data validation guidelines contained in the following documents: *Guidance Document for the Assessment of RCRA Environmental Data Quality*, draft dated 1988 and *National Functional Guidelines for Organic Data Review*, draft 1999. To accomplish data evaluation, the criteria listed in the following subsections will be assessed.

11.5 PRECISION, ACCURACY AND COMPLETENESS

11.5.1 Precision

Precision is a measure of data variability. Variability can be attributed to sampling activities and/or chemical analysis. Relative percent difference (RPD) is used to assess the precision of the sampling and analytical method and is calculated as follows.

RPD = 100[(Xs - Xd)/(Xs + Xd)]/2

where

RPD	=	relative percent difference
Xs	=	sample analytical result
Xd	=	duplicate sample analytical result

11.5.2 Accuracy

Accuracy is a measure of the error between chemical analytical results and the true sample concentrations. Accuracy is a measure of the bias in a system and will be expressed as the percent recovery of spiked samples. The accuracy will be presented as percent recovery and will be calculated as follows.

PR = 100(Xss - Xs)/T

where

PR	=	percent recovery
Xss	=	spike sample analytical result
Xs	=	sample analytical result
T	=	known spike concentration

11.5.3 Completeness

Completeness is evaluated to assess whether a sufficient amount of valid data is obtained. Completeness is described as the ratio of acceptable measurements to the total planned measurements. Completeness is calculated as follows.

C = (Number of samples having acceptable data)/
(total number of samples analyzed) x 100%

where

C	=	completeness

11.6 REPORTING, DOCUMENTATION, DATA REDUCTION AND CORRECTIVE ACTION

Upon receipt of each laboratory data package, data will be evaluated against the criteria outlined in the previous sections. Any deviation from the established criteria will be noted and the data will be qualified, as appropriate. A review and discussion of analytical data QA/QC will be submitted in a report to be attached to the RI report. Data validation procedures for all samples will include checking the following, when appropriate.

1. Holding times
2. Detection limits
3. Field equipment rinseate blanks
4. Laboratory blanks
5. Laboratory matrix spikes
6. Laboratory matrix spike duplicates
7. Laboratory blank spikes
8. Laboratory blank spike duplicates
9. Surrogate recoveries

If significant quality assurance problems are encountered, appropriate corrective action as determined by GeoEngineers' project manager and/or the chemical analytical laboratory will be implemented as appropriate. All corrective action will be defensible, and the corrected data will be qualified.

Spatial information collected during the field event will be analyzed and displayed using ArcGIS 9.1 and EQUIS 3 to manage the chemical analytical data.

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
1. Additional characterization is needed to define the extent of soil contamination at the site. The aerial and vertical extent of soil contamination needs to be further defined in the vicinity of DP02 and DP04 (including westward beneath Jefferson Street and on adjacent offsite parcels if necessary) and north of DP18.	TPH-D, TPH-MO, arsenic, and cadmium in the 2-6 feet interval were the only COPC exceedances at DP04. These COPCs have been delineated laterally in this interval to the northeast and south with MW08 and DP03, respectively. A new soil boring will be advanced northwest of DP04 to complete the lateral delineation of COPC screening level exceedances in the 2-6 feet interval. Soil samples will also be obtained from beneath existing railroad tracks to be removed during infrastructure construction activities. The railroad tracks are currently embedded in the asphaltic pavement along Jefferson Street and we expect that the section beneath the pavement will consist of railroad ties supporting the rail and ballast material (typically 3 feet of crushed rock) supporting the ties. Soil samples will be collected at the soil/ballast interface. We will analyze soil collected beneath the ballast material for cPAHs (using EPA Method 8270C), TPH, and metals to assess potential residual soil contamination associated with the ties.	DP37	0-2										
			2-6	x [a]	X	X	x		x	X			light sand fill
			6-10	X	X	X	x			X			dark sand fill
	TPH-MO in the 2-6 feet interval was the only significant COPC exceedance at DP02. This COPC has been delineated laterally in this interval to the north and southeast with DP03 and DP16, respectively. A new soil boring will be advanced southwest of DP02 to complete the lateral delineation of the TPH-MO screening level exceedance in the 2-6 feet interval. A sample from 10 to 14 feet from the monitoring well boring for MW25S will be tested for TPH-MO to evaluate the vertical extent of this COPC identified in previous samples from DP02. Proposed shallow screen interval for MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04. Soil samples from below the railroad tracks will also be collected and analyzed from DP38 and analyzed for PAHs. PAHs will be tested in sample from 10 to 14 foot depth interval in the boring for MW25S to evaluate the vertical extent of this COPC identified previously at DP02 and DP16. One sample from DP38 will be tested for dioxins/furans to evaluate soil within the infrastructure corridor.	DP38	1-3				x		x				
			4-6	x	X	X	x	x	x		x		light sand fill
			6-10	X	X	X	x	x	x		x	9	Silt or dark sand fill
		MW25S	0-2										
			2-6										
			6-10	x	X	X	X		X				Silt or dark sand fill
			10-14	x	X	X	X		x				Silt or dark sand fill
	TPH-MO in the 10-14 feet interval was the only significant potential COPC exceedance at DP18. This COPC has been delineated latreally in the vadose zone and saturated zone with MW03, MW16, and DP17 but has not been delineated laterally north of DP18. Soil samples from the boring for MW23S will provide this information. Proposed screen interval for MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18. TPH-MO will be tested in MW-23S at the 6 to 10 and 10 to 14 foot intervals to evaluate the vertical extent of TPH-MO identified previously at DP18.	MW23S	0-2										
			2-6										
			6-10	x [a]	X	X	X		X				light sand fill
			10-14	x	X	X	X		X				light sand fill
2. Additional characterization is needed to define the extent of soil contamination at the site. The vertical extent of contamination needs to be defined in the vicinity of DP06 and DP08.	TPH-G in the 2-6 feet interval was the only significant potential COPC exceedance at DP06 and needs to be defined at depth and to the south. TPH-D and TPH-MO in the 2-6 feet interval were the only significant potential COPC exceedances at DP08. TPH-D and TPH-MO exceedance was identified in the 2-6 feet interval in DP-13. The vertical extent of gasoline, diesel and oil contaminated soil has been delineated with DP24, DP15, DP14, MW-5, MW-8 and MW-10. MW24S, along with the other proposed and existing wells, will be used to evaluate the leaching to groundwater pathway via empirical demonstration per WAC 173-340-747(9) an (10)(c). Proposed shallow screen interval for MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	MW24S	4-6	X	X	X	X		X				
			6-10	X	X	X	X		X				
	Evaluate lateral extent of TPH-D and MO identified previously at DP08 and DP13. Evaluate lateral extent of gasoline exceedance at DP08 and DP13.	DP39	0-2	X	X	X	X		X				
			2-6	x [a]	X	X	X		X				dark sand fill
	Lateral and vertical extent of dioxins/furans by TP03. Evaluate thickness of pre-1891 fill. Collect data to support management of soil that will be excavated as part of the infrastructure improvements. DP40 will also help evaluate the extent of diesel and oil contamination previously observed in DP13 and DP08 at 2-6 feet.	DP40	0-2	x	X	X	x	x	x				light sand fill
			2-4	x	X	X	x	x	x		x		light sand fill
			4-6	x	X	X	x	x	x		x	3.5	dark sand fill
3. Additional characterization is needed to define the extent of soil contamination at the site. The aerial extent of contamination has not been defined in the vicinity of MW19.	TPH-G in the 2-6 feet interval was the only potential COPC exceedance at MW19. Two soil borings (DP28 and the boring for MW21s) will be located near MW19 to evaluate the aerial extent of the screening level exceedance of TPH-G at MW19 in the 2-6 feet interval. The proposed screen interval (2 to 7 feet bgs) for MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19. Moreover, a soil boring advanced to the west of MW19 in response to Ecology Comment #7 (i.e. DP27) will also be sampled for TPH-G in the 2-6 feet interval to provide lateral delineation to the west. To address Ecology comment 7, if evidence of burned wood or ash is observed in boring DP28, which is located on the northern edge of parcel 1 near the former Refuse Fire Area, a sample of this material will be analyzed for dioxins and furans.	DP28	0-2	X	X	X	X						
			2-6	X	x	X	X						light sand fill
		MW21S	0-2										
			2-6		x [a]								light sand fill

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
4. Additional characterization is needed to define the extent of soil contamination at the site. Area of Concern (AOC) #16 (pad mounted transformer) needs to be evaluated. Soil samples should be collected from this area for petroleum hydrocarbons and PCBs. The location of well MW04 does not appear to be close enough to this AOC to be adequate.	One new boring will be advanced and sampled within AOC 16 as recommended by Ecology. The targeted depth for the soil sample collected from this boring is the elevation of the former transformer pad located in AOC 16. The sample from this boring will be analyzed for PCBs and mineral oil range petroleum hydrocarbons (NWTPH-Dx).	DP35	0-2										
			2-6	x						x			gravel fill
5. Parcel 1 needs to be assessed. AOCs #43 through 48 and #50 have not been adequately assessed. Also, the northern portion of Parcel 1 needs to be assessed.	The first sentence of this comment does not apply because the East Bay Redevelopment Project Area only includes the northwest portion of Parcel 1. A new boring (DP36) located in the right-of-way of Olympia avenue adjacent to the northwest portion of Parcel 1will address Ecology's concern regarding the northern portion of Parcel 1. However, the primary purpose of this boring is to evaluate soil conditions to assist in planning of future infrastructure improvements in this area and evaluate residual concentrations of COPCs in an area where historical sources were not located.	DP36	1-3					x					gravel fill
			2-6	x	x	X	x	X					silt
			6-10					X				9	silt
6. Additional characterization of dioxins/furans is needed. As shown in the report, concentration of dioxins/furans that exceed the MTCA Method B Soil Cleanup Level of 11 nanograms per kilogram (ng/kg) or parts per trillion (ppt), expressed as a Total Toxicity Equivalency Factor (TEF), were observed at all four locations tested for this constituent. The reported TEF values from these locations range from 57.9 to 645 ng/kg. Because the highest concentration (TP02) is near the east property line and near an adjacent public walking path and grassy area, additional samples for dioxins/furans should be collected in this adjacent area. Also, an analysis of wind direction should be performed to help predict locations that may show higher dioxin concentrations.	New boring DP33 will provide vertical profile of dioxins/furans concentrations near TP2. Selection of sample locations based on prediction of wind direction is not necessary because the proposed dioxins/furans sample locations (as outlined in this table) provide spatial coverage across the site.	DP33	0-2					x	x	x			gravel fill
			2-4				x	x	x		x		gravel fill
			4-6				x	x	x				light sand fill
			6-8					x				9	light sand fill
7. Additional characterization of dioxins/furans is needed. Parcel 7 is located adjacent to the Refuse Fire Area (Area of Concern #1), which is a potential source of dioxins/furans contamination. Additional soil samples for dioxins/furans analyses should be performed in Parcel 7. These samples will provide additional dioxins/furans data for the site and may help to determine whether AOC #1 was a source.	Additional samples which address Ecology's comment 7 will be collected and tested for dioxins/furans from a boring advanced near AOC 1 (DP27) and a boring advanced at the northern edge of Parcel 7 (DP28). In addition, DP27 will be sampled for TPH-G to address gasoline contamination identified in soil at MW-19 (see response to Ecology Comment #3). Samples from boring DP27 will also be analyzed for PAHs to evaluate the lateral and vertical extent of cPAHs identified in soil samples from MW-20, near the Refuse Fire Area. Note that Parcel 8, which is adjacent to the northwest portion of the Site, is being addressed by LOTT Alliance through Ecology's Voluntary Cleanup Program.	DP27	0-2					x	x	x			light sand fill
			2-4		x	X	x	x	x		x		light sand fill
			4-6				x	x	x		x		silt
			6-8				x	x				3	silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration Boring (DP) Well (MW)	Sampling Depth Interval (ft bgs)[1]	Soil Analyses NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]	Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
8. Additional characterization of dioxins/furans is needed. Section 4.3.1 states that "dioxin testing appears to indicate that the historical working surface (depth of about 2 feet below existing grade) is impacted." Please provide more detail on what is meant by "historical working surface" and how it is distinguished. According to the Supplemental Site Use History report, the boiler house (AOC #17) operated circa 1932 and the power house (AOC #22-24) operated from at least 1941 through 1958. Was 2.0 feet below current grade the historical grade for these facilities? If so, what evidence is there for this? Dioxin samples were collected at the 2.0 foot depth at AOC #17, at the 3.5 depth at AOC #22-24, and at the 1.5 and 2.0 foot depths at the two randomly selected locations. It is recommended that additional samples be collected at AOC #17 so that a concentration verses depth profile can be determined.	The "historical working surface" is the sometimes woody and compacted historical grade where industrial buildings were located and operations were conducted on the property prior to later filling and grading. Based on our review of historical information the working surface is located about 1 to 4 feet below existing grade, however it can be difficult to identify in borings due to similarity in lithology of fill in this depth interval. Because of Ecology's questioning of the historical working surface and difficulty in determining its exact location in borings, a more appropriate rationale for the location of explorations where vertical profiles for dioxins/furans testing is as follows:1) complete a profile (DP33) adjacent to previous sample with high dioxins concentrations (TP02) and 2) complete a profile that represents temporal fill sequences.	See DP 33 (Comment 6) and borings and "Additional Explorations" rationale below.										
9. Additional characterization of groundwater contamination, flow direction, and gradient is needed. Groundwater monitoring wells MW-1 through MW·11 and MW-14 were installed with their screened interval submerged below the water table. Wells that monitor for light non-aqueous phase liquids (LNAPL, such as petroleum hydrocarbons) should be completed so that their screen straddles the water table. Therefore, to accurately evaluate whether groundwater is contaminated from LNAPL constituents, it will be necessary to install additional groundwater monitoring wells with screens that extend above the water table at selected locations where the existing monitoring wells are not adequate. Please present your proposed new well locations to us for review and approval.	Given the general lack of dissolved-phase petroleum constituent detections in the groundwater samples collected from existing MWs (as well as the relatively low TPH soil concentrations detected in soil samples collected from areas with suspected hydrocarbon contamination), it is unlikely that the typical placement of the screened intervals straddling the water table would result in measurable LNAPL thicknesses or even a screening level TPH exceedance at any MW at this site. Nonetheless, five shallow MWs (MW21S through MW25S) with screens straddling the water table are proposed to address this comment. MW21S and MW24S are discussed in the responses to Ecology Comments #2 and #3, respectively. Proposed MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06. MW23S and MW25S are discussed in the response to Ecology Comment #1. This Ecology comment is further addressed by in the Groundwater Monitoring Plan. Based on recent comments from Ecology (9/22/08 Ecology comment letter and subsequent discussion), because artesian wells at the Site may be influencing shallow groundwater, an attempt will be made to locate and decommission or otherwise mitigate leakage from the artesian wells. If the artesian wells are found and decommissioned, water levels and the need for shallow monitoring wells will be reevaluated.	MW22S	No analysis of soil samples unless field observations indicate the presence of contamination. Anticipated screened interval is 1-6 feet bgs.									
Additional Explorations													
Additional explorations to evaluate the nature and extent of contamination, including dioxins/furans. These explorations will provide data related to: a) regional area background concentrations of dioxins/furans and metals not related to a site release, b) management of soil that will be excavated as part of the infrastructure improvements, and c) evaluation of COPC distribution in different fill types and spatial coverage related to general extent of COPCs.	Evaluate extent of lead and PAHs at DP11.	DP29	0-2						x				light sand fill
			2-6				x						silt or gravel
			6-10				x						silt or gravel
			10-14						x				silt or gravel
	Evaluate dioxins/furans in fill (1891 to 1908 time interval), evaluate dioxins/furans in soil within the infrastructure corridor, and provide additional sampling data for parcel 9.	DP30	0-2				x	x					light sand fill
			2-4				x	x	x				light sand fill or silt
			6-8				x	x (if silt)				9	light sand fill or silt

TABLE 1
PROPOSED NEW BORING AND MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Ecology Comment	Response to Ecology Comments/Sampling Rationale	Exploration	Sampling Depth Interval (ft bgs)[1]	Soil Analyses								Planned Utilities - Maximum Depth (feet)	Anticipated Soil Type / Lithologic Unit
		Boring (DP) Well (MW)		NWTPH-Dx	NWTPH-G	BTEX	Total Metals (As, Cd, Pb)[2]	D/F	PAHs	PCBs	TOC[3]		
	Locations DP31 and DP41 are selected to obtain dioxins/furans data from soil not associated with any AOC source. This data will be used to evaluate dioxins/furans concentrations related to regional dioxin sources and regional background levels as it is possible that detected concentrations of dioxins/furans and metals in soil samples collected to date are attributable to an area or regional background rather than a site release. DP31 is located on parcel 6 in an area where no historical sources (AOCs) were located and the underlying fill is from the 1948 to 1975 time period. DP41 is located on parcel 2 in an area where no historical sources (AOCs) were located and the underlying fill is from the post 1975 time period.	DP31	0-2					x					light sand fill
			2-6	x			x	x					light sand fill
		DP41	0-2					x					gravel fill
			2-6				x	x					silt
	Evaluate dioxins/furans in post-1975 fill within the infrastructure corridor. These data will assist with evaluating background conditions as well as inform waste characterization and disposal associated with the excavated infrastructure corridor soils.	DP32	0-2					x			x		gravel fill
			2-6				x	x	x		x		gravel fill
			6-9					x				9	gravel fill
	Evaluate dioxins/furans in fill (1891 to 1908 time interval) near infrastructure corridor and on Parcel 4.	DP34	0-2					x					light sand fill
			2-6	X	X	X	x	x	x		x		light sand fill
			8-10	X	X	X	x	x	x			10	light sand fill or gravel
	These borings are located on Parcel 4 and the locations were selected to gather information to support soil characterization during construction activities associated with the Children's Hands on Museum.	DP26	0-2				X	x	X				light sand fill
			2-6					x	X				silt or light sand fill
			6-10				X	X					
		DP42	0-2				X	x					gravel fill
			2-6				X	x					light sand fill
			6-10				X	X					

Notes:

Blank boxes (no X) indicate that soil samples will be collected from the specified depth intervals and held for potential analyses by the analytical laboratory

Shaded cells indicate explorations and samples that will be collected in first phase of investigation

[1] Samples will be collected approximately every 2 feet in soil borings for field screening and potential chemical analyses. Discrete soil samples will be obtained from within the depth intervals shown in this column (rather than composite samples.) The depth ranges represent the intervals that a sample will be analyzed for the COPCs identified in the Soil Analyses columns. Additional samples may be analyzed if field observations indicate the presence of contamination.

[2] The metals listed; arsenic, cadmium and lead, represent metals that had concentrations exceeding screening levels in one or more locations. Some soil samples collected from the infrastructure corridor may also be analyzed for "RCRA 8" metals to provide data needed by soil disposal facilities. The RCRA metals include arsenic, barium, cadmium, chromium, lead, mercury, selenium & silver.

[3]TOC= total organic carbon. TOC and other physical soil properties such as grain size may also be analyzed at various locations for the possibility of establishing site specific Method B cleanup levels.

[a] Also analyze for EPH.
[b] Also analyze for total organic carbon
x = sample collected for analytical testing. Red X = additional analytical testing requested by Ecology in it's September 22, 2008 comment letter.
As = Arsenic, Cd = Cadmium, Pb = Lead
PCBs = Polychlorinated biphenyls
HCID = Hydrocarbon Identification test (NWTPH-HCID)
NWTPH-Dx = Diesel-range and motor oil-range total petroleum hydrocarbons
TPH-MO = motor oil-range petroleum hydrocarbons
D/F = Dioxins and furans
NWTPH-G = Gasoline-range total petroleum hydrocarbons

TABLE 2
PROPOSED NEW MONITORING WELL RATIONALE
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

				Existing Well Data[2]		
Well I.D.	**Purpose**	**Installation Method/Well Diameter**	**Proposed Well Screen Interval (BGS-feet)[1]**	**Nearest Existing well**	**Highest DTW**	**Lowest DTW**
MW21s	MW21S addresses Ecology Comment #9 for detected TPH in soil at MW19.	Direct push/1-inch	2 to 7	MW19	3.47	3.78
MW22s	MW22S will be used to evaluate LNAPL thicknesses and petroleum constituent concentrations near MW06.	Direct push/1-inch	1 to 6	MW6	0.84	1.14
MW23s	MW23S addresses Ecology Comment #9 for detected TPH in soil at DP18.	Direct push/1-inch	4 to 9	MW16	5.41	6.35
MW24s	MW24S addresses Ecology Comment #9 for detected TPH in soil at DP06, DP08, DP24, and DP13.	Direct push/1-inch	2.5 to 7.5	MW10	3.48	3.8
MW25s	MW25S addresses Ecology Comment #9 for detected TPH in soil at DP02 and DP04	Direct push/1-inch	2 to 7	MW7 and MW8	5.0 & 2.55	5 & 2.62

Notes:

Based on recent comments from Ecology, because artesian wells at the Site may be influencing groundwater levels, an attempt will be made to locate and decommission the artesian wells. If the artesian wells are found and decommissioned, the need for shallow monitoring wells will be reevaluated.

[1]Across water table with one foot of screen above predicted high water table elevation and four feet of screen below this elevation, subject to approval by Ecology and issuance of well construction variance.

[2] Based on depth to water measurements collected August 2007 and July 2008 during low and high tides.

bgs=below ground surface

DTW = depth to water in feet as measured from top of well casing. Top of well casings for referenced wells is approximately at ground surface.

Seep 4 [10]	Groundwater/surface water interface													NA	x	x	x	x	x	x	x	--	--

Notes:

[1]Dissolved metals to be tested in addition to total metals at locations where metals exceedances have been measured. Also test these samples for aluminum and iron (Al and Fe^{3+}) to represent suspended clay particles. Results to potentially be used for evaluating sorption of COPCs.

[2]MW05, MW12, MW16 and MW18 are downgradient wells between the subject property and East Bay. These wells will be considered for potential future compliance wells.

[3]MW04, 05, 06, 07, 08, 10 were sampled and tested July 13, 2007 for diesel-range hydrocarbons only.

[4]MW01 through MW10 were installed in January 2007. MW11 through MW20 were installed in July and August 2007.

[5]MW14 was not sampled in 2007 because other monitoring wells surrounding MW14 were sampled and tested.

[6]Note on SVOCs. The only SVOC exceedances were cPAHs, therefore only cPAHs will be analyzed, rather than the full SVOC list.

[7]Note on PCBs. PCBs have not been detected in any of the groundwater samples obtained from MW01 through MW20 at the site; nor have they been detected above soil screening levels. Therefore PCBs will only be tested at locations where low level detections of PCBs were detected in soil on Parcel 3 and near the former transformer location (MW04).

[8]Note on Dioxins/Furans. Dioxin/Furans were not detected in a groundwater sample obtained and tested from MW16 in August 2008. Dioxin sampling and testing approach is based on obtaining samples from potential source area wells that are also downgradient compliance wells (MW05 and MW16). If dioxins/furans are detected in groundwater at MW05 or MW16, then additional testing will be conducted at the other compliance wells (MW04, MW11, MW12

[9]This well will not be installed if water levels drop sufficiently after the artesian wells are decommissioned if the existing paired monitoring well screen is not totally submerged.

[10]Water from this seep area will only be sampled if it is determined to represent groundwater (see Section 5.4.2 of Sample and Analysis Plan)

x = sample collected for analytical testing
Y = Yes; N = No; NA = not applicable; "--" = Not tested
TPH-Gasoline by Ecology Method NWTPH-Gx
TPH-Diesel and Oil by Ecology Method NWTPH-Dx
VOCs (volatile organic compounds) by EPA Method 8260B
RCRA Metals (As, Ba, Cd, Cr, Pb, Ag, Se, Hg) by EPA Methods 6000/7000
PAHs (polycyclic aromatic hydrocarbons) by EPA Method 8270sim
PCBs (polychlorinated biphenyls) by EPA Method 8082
Dioxins/Furans by EPA Method 1613B
ORP = Oxidation Reduction Potential
DO = Dissolved Oxygen
Fe = Iron
Al = Aluminum
COPCs = contaminants of potential concern

TABLE 4
SOIL ANALYTICAL TARGET REPORTING LIMITS
EAST BAY REDEVELOPMENT
PORT OF OLYMPIA

Analytes	Units	Analytical Laboratory Criteria[1]	
		Target Reporting Limits	Analytical Method
Total Petroleum Hydrocarbons

East Bay Redevelopment Site, Olympia, Washington
Ecology Facility/Site No. 5785176, Agreed Order DE5471

Dear Mr. Teel:

Thank you for your October 31, 2012 letter providing comments on the aforementioned work plan. On behalf of the Port of Olympia (Port) and in accordance with our November 7, 2012 meeting, PIONEER Technologies Corporation (PIONEER) is submitting for your review the attached responses to comments. A revised work plan will be submitted for your review and approval within 30 days after approval of these responses.

If you have further questions or comments regarding these responses, please do not hesitate to contact me at (360) 570-1700.

Respectfully,

Troy Bussey Jr., P.E. (WA, CA), L.G. (WA), L.HG. (WA)

RESPONSES TO ECOLOGY COMMENTS
Ref: Ecology Letter to Port of Olympia dated October 31st, 2012

August 10, 2012 Data Gap Work Plan for Soil-to-Indoor Air Pathway at East Bay Redevelopment Site

#	Comment	Response
1	Delete the collection of soil samples from SVP-1 and -2. Collection of soil gas samples from dedicated boring locations will result in more representative soil gas samples. Any soil samples that are collected for analysis shall be done with separate borings that are installed after all soil gas samples have been collected.	As discussed during our November 7, 2012 meeting, the work plan will be revised so that soil samples are collected from soil borings advanced adjacent to SVP-1 and SVP-2 (e.g., offset approximately two feet) after the soil gas samples are collected from SVP-1 and SVP-2.
2	The driller shall ensure that the Post-Run Tubing (PRT) tip threads and seat shall be cleaned on a daily basis (or more frequently if needed) and the O-ring shall be changed daily.	The work plan will be revised to indicate that the driller will clean the PRT tip threads and seat on a daily basis (or more frequently if needed), and change the O-ring daily.
3	Only rigid wall tubing shall be used. The tubing above the PRT connector shall be thick-wall so that sufficient torque is available to screw the tip tightly into the seat.	The work plan will be revised to clarify that the ¼-inch-diameter Teflon tubing being used is rigid wall tubing.
4	The drive point shall be installed to a depth of at least 5 feet below grade (fbg) and the point that soil gas enters the tubing (sampling point) shall be at a depth of at least 5 fbg.	The work plan will be revised to clarify that the top of the drive point will be at least five feet below ground surface (bgs) (the work plan currently states the drive point will be approximately five feet bgs).
5	The rods shall be pulled back no more than 6 inches above sampling point.	The work plan will be revised to indicate that the rods will be pulled back no more than 6 inches above the sampling point (the work plan currently states that rods will be pulled back approximately 6 to 12 inches).
6	An equilibration period of 60 minutes shall be observed after soil gas probe installation and prior to shut-in testing, leak testing, purging, and sampling. The time period for equilibration shall begin after the rods have been pulled back.	The work plan will be revised to incorporate the requested changes.
7	Section 2.2 and Table 4: Delete the use of an eight-hour sampling period and 6-liter Summa Canister. All soil gas samples shall be collected using a Summa canister size of 1-liter and the regulator shall be adjusted by the laboratory so that the flow rate is between 100-200 milliliters per minute. Probe vacuum shall be < 100 inches water (or <8 inches mercury).	Although PIONEER and the Port generally believe that longer sample periods and larger sample volumes provide more representative soil gas data, the work plan will be revised to incorporate the requested changes.
8	We do not recommend the collection of an ambient air sample for this investigation. Ecology's 2009 draft Soil Vapor Guidance document does not recommend the collection of ambient air samples in a Tier 1 Assessment. If an ambient air sample is to be collected against	As discussed during our November 7, 2012 meeting, it is a PIONEER standard operating procedure to collect at least one synoptic, upwind ambient air sample during every vapor intrusion (VI) investigation we conduct (regardless of whether it is a Tier 1, Tier II, or other VI investigation). The purpose of collecting the

RESPONSES TO ECOLOGY COMMENTS
Ref: Ecology Letter to Port of Olympia dated October 31st, 2012

August 10, 2012 Data Gap Work Plan for Soil-to-Indoor Air Pathway at East Bay Redevelopment Site

#	Comment	Response
	Ecology's recommendation, please describe specifically what this data will be used for.	ambient air sample is to approximate ambient air background concentrations at the time of soil gas sampling. The constituents of interest for this soil gas investigation (i.e., benzene, toluene, ethylbenzene, and xylenes) are ubiquitously present in ambient air at detectable concentrations. Since ambient air often mixes with shallow soil gas, the soil gas concentrations measured during this investigation could be influenced by background constituent concentrations in ambient air. Thus, the ambient air data could be a helpful line of evidence, if necessary, to help determine whether or not soil gas concentrations were significantly affected by ambient air concentrations. Although Ecology's 2009 draft VI guidance document does not recommend collection of an ambient air sample during a Tier I Assessment, it also does not specifically recommend not collecting an ambient air sample. Since Ecology's 2009 draft VI guidance document does recommend collection of an upwind ambient air sample as part of a Tier II Assessment, it is prudent to collect an upwind air sample as part of this investigation.
9	Soil gas sampling shall not be performed immediately following a significant rain event.	As discussed during our November 7, 2012 meeting, PIONEER and the Port agree that soil gas samples should not be collected when vadose zone pores are saturated. As a result, the work plan will be revised to indicate that soil gas samples will not be collected if (1) ponded water on the ground surface is present within 20 feet of a SVP, or (2) it has been less than 48 hours since it rained more than ½-inch in a 24-hour period. Given the amount of ponded water typically at the Site during the winter, note that these criteria will likely mean that soil gas samples will not be collected before late spring at the earliest.
10	Soil vapor samples shall be analyzed for oxygen, carbon dioxide, methane, nitrogen, and helium by ASTM D1946.	As discussed during our November 7, 2012 meeting, PIONEER and the Port understand that some of these proposed analyses are intended as a line of evidence to help evaluate whether or not aerobic degradation is likely occurring for the constituents of interest. The work plan will be revised to incorporate the analyses of these constituents as requested.

RESPONSES TO ECOLOGY COMMENTS
Ref: Ecology Letter to Port of Olympia dated October 31st, 2012

August 10, 2012 Data Gap Work Plan for Soil-to-Indoor Air Pathway at East Bay Redevelopment Site

#	Comment	Response
11	Soil gas sample collection shall be stopped when the vacuum gauge on the sampling canister indicates that between 3 to 5 inches of mercury vacuum is remaining.	The work plan will be revised to incorporate the requested change (the work plan currently states that sample collection will be stopped when the remaining canister volume is 5 inches of mercury).
12	Please add a section describing how soil and soil gas sample borings will be decommissioned.	The work plan will be revised as requested to indicate that the driller will decommission the soil borings and SVP borings by backfilling the boreholes with bentonite chips and hydrating the bentonite chips.
13	Please add a section discussing field quality control (QC). Field QC soil gas samples shall include equipment blanks and duplicate samples. Equipment blanks shall be collected from the assembled soil gas probe (including tip and tubing) on a daily frequency. Duplicate samples shall be collected by using a T-splitter at the point of sample collection to divide the sample stream into two separate containers. Duplicate samples shall be collected on a daily frequency.	As requested, a field QC section will be added to the work plan and field QC samples will be collected. One field duplicate sample will be collected during the sampling event using a T-splitter at the point of sample collection. One equipment blank per sampling event will be collected after the soil gas samples are collected. The equipment blank sample will be collected by connecting a Summa canister and dedicated to the cleaned, non-dedicated PRT equipment after the PRT equipment is placed on the ground surface in a non-impacted location. Note that the equipment blank sample will be affected by ambient air background concentrations.
14	Delete Attachment C. Ecology does not agree with the soil gas screening level calculations presented in Attachment C. As stated in Appendix D of the Soil Vapor Guidance, Ecology does not recommend that investigators rely upon Johnson and Ettinger Model predictions when the source is vadose zone soils. Other issues with Attachment C include the lack of soil gas sample data from the Site and the use of an attenuation factor that is inconsistent with Table B-1 of the Guidance.	As requested, the work plan will be revised by deleting Attachment C and using the default soil gas screening levels in Table B-1 of Ecology's 2009 draft VI guidance document (based on a default soil gas-to-indoor air attenuation factor of 0.1). However, PIONEER and the Port firmly believe that the soil gas screening level calculations in Attachment C are consistent with Ecology's 2009 draft VI guidance document, and are appropriate for this investigation. As a result, PIONEER and the Port may use the Johnson and Ettinger Model (JEM) calculations in Attachment C as necessary when evaluating the data collected pursuant to the work plan. As stated in Appendix D of Ecology's 2009 draft VI guidance document, "JEM is a handy VI assessment tool and Ecology endorses its use during Tier I screening." As discussed during our November 7, 2012 meeting, please note the following about the text in Appendix D of Ecology's 2009 draft VI guidance document and the JEM calculations in Attachment C:

RESPONSES TO ECOLOGY COMMENTS
Ref: Ecology Letter to Port of Olympia dated October 31st, 2012

August 10, 2012 Data Gap Work Plan for Soil-to-Indoor Air Pathway at East Bay Redevelopment Site

#	Comment	Response
		• The text on page 24 of Appendix D about not using JEM predictions when the VI source is vadose zone soil is strictly in the context of using the JEM soil-to-indoor air spreadsheet. The JEM soil-to-indoor air spreadsheet is not the JEM spreadsheet being used in Attachment C. Rather, the soil gas-to-indoor air JEM spreadsheet, which is recommended in Appendix D for these situations, is used in Attachment C. • The calculations presented in Attachment C are equally protective of human health regardless if the JEM is operated in forward calculation mode or backward calculation mode. Appendix D of the guidance discusses using the JEM in "forward calculation" mode, where a measured soil gas concentration is inputted and used to predict an expected indoor air concentration, which is then compared with an indoor air screening level. Attachment C of the work plan uses the same JEM equation in "backward calculation" mode. In "backward calculation" mode, a protective (or target) indoor air concentration is determined, and then the JEM is used to back calculate the soil gas concentration that will produce the target indoor air concentration. This soil gas concentration is the protective soil gas screening level. • Appendix D of the guidance discusses Ecology concerns about using various site-specific input assumptions during a screening level evaluation (as opposed to relying upon conservative default input assumptions). As shown in Attachment C of the work plan, all of the JEM inputs used in the Attachment C calculations were conservative, default input assumptions.
15	Please add that Ecology will be provided 48-hours notice of the beginning of field work.	The work plan will be revised to incorporate the requested change.

East Bay Redevelopment Site, Olympia, Washington
Ecology Facility/Site No. 5785176, Agreed Order DE5471

Dear Mr. Teel:

Thank you for your February 28, 2013 letter approving the February 19, 2013 response to comment (RTC) document and for providing an additional comment on the August 10, 2012 Data Gap Work Plan for Soil-to-Indoor Air Pathway. On behalf of the Port of Olympia (Port), PIONEER Technologies Corporation (PIONEER) is submitting the attached RTC for the additional February 28th comment. A revised work plan will be submitted for your review and approval within 30 days after approval of this RTC.

If you have further questions or comments regarding this RTC, please do not hesitate to contact me at (360) 570-1700.

Respectfully,

Troy Bussey Jr., P.E. (WA, CA), L.G. (WA), L.HG. (WA)

1. Response to Ecology Comment

RESPONSE TO ECOLOGY COMMENT
Ref: Ecology Letter to Port of Olympia dated February 28, 2013

August 10, 2012 Data Gap Work Plan for Soil-to-Indoor Air Pathway at East Bay Redevelopment Site

#	Comment	Response
1	Currently, the plan proposes to analyze the following contaminants of concern in soil gas by EPA Method TO-15: benzene, toluene, ethylbenzene, and total xylenes (BTEX). However, there are additional constituents that either have been detected in soil samples from the Site (such as naphthalene) or that could be present in soil gas from a gasoline source (such as I ,3-butadiene, hexane, chloromethane, ethylene dibromide, 1,3,5-trimethylbenzene, and 1,2,4-trimethylbenzene). **Therefore, please modify the work plan to include the full list of TO-15 analytical constituents.**	The work plan is designed to collect additional data to further evaluate the soil-to-indoor air pathway due to concentrations of total petroleum hydrocarbons in the gasoline range (TPH-G) in three soil samples that were less than three times the TPH-G soil screening level. Since there are no Model Toxics Control Act (MTCA) Method B air cleanup levels for TPH-G, BTEX were originally selected as TPH-G surrogates for this investigation because BTEX constituents typically comprise a larger percentage of a gasoline mixture than other gasoline components. Nonetheless, the work plan will be revised to add the analysis of the following constituents consistent with MTCA Table 830-1 requirements for a TPH-G release: • n-hexane • 1,2-dibromoethane • 1,2-dichloroethane • methyl tertiary-butyl ether • naphthalene [(1)] In addition, the work plan will be revised to add the analysis of the following constituents since they were detected in one of the soil samples with a TPH-G screening level exceedance, are typically associated with gasoline, and have soil gas screening levels in Appendix B of Ecology's 2009 draft vapor intrusion guidance document: • 1,2,4-trimethylbenzene • 1,3,5-trimethylbenzene Analysis of additional volatile organic compounds (VOCs) beyond those listed above (i.e., the full TO-15 analyte list) is not required per MTCA Table 830-1 and is not warranted for this situation (i.e., minor TPH-G exceedances in soil). Furthermore, analysis of non-target VOCs can significantly complicate vapor intrusion evaluations due to the ubiquitous presence of many VOCs in ambient air and shallow soil gas at background concentrations that often exceed screening levels. The constituents listed in this response will be analyzed in all media (i.e., soil, soil gas, and ambient air).

[(1)] 1-methylnaphthalene and 2-methylnapthtalene cannot be analyzed by Method TO-15 due to their molecular size. In addition, Appendix B of Ecology's 2009 draft vapor intrusion guidance document does not have screening levels for 1-methylnaphthalene, 2-methylnaphthalene, or total naphthalenes.

Subject: Data Gap Work Plan for the Soil-to-Indoor Air Pathway and Response to Comments for Ecology's March 14, 2013 Comments East Bay Redevelopment Site, Olympia, Washington Ecology Facility/Site No. 5785176, Agreed Order DE5471

Dear Mr. Teel:

On behalf of the Port of Olympia (Port), PIONEER Technologies Corporation (PIONEER) is enclosing two copies of the revised Data Gap Work Plan for the Soil-to-Indoor Pathway at the East Bay Redevelopment Site (Site) for your review and approval. The work plan incorporates the Washington State Department of Ecology (Ecology) comments provided in an October 31, 2012 letter and a February 28, 2013 letter, in accordance with the February 19, 2013 and March 12, 2013 response to comments (RTC) documents. All RTC documents are included in Attachment C of the work plan for reference.

The enclosed work plan was not revised to address the comments in your March 14, 2013 letter for the reasons presented in the associated RTC (see Attachment C of the work plan). If the event that you do not agree with the RTC for the March 14th comments, the Port would like to request an April meeting to quickly reach final resolution on the issue.

Respectfully,

Troy Bussey Jr., P.E. (WA, CA), L.G. (WA), L.HG. (WA)

Enclosures:
1. Data Gap Work Plan for the Soil-to-Indoor Pathway at the East Bay Redevelopment Site

RESPONSE TO ECOLOGY COMMENTS
Ref: Ecology Letter to Port of Olympia dated March 14, 2013

Data Gap Work Plan for the Soil-to-Indoor Air Pathway at the East Bay Redevelopment Site

#	Comment	Response
1	The response references MTCA Table 830-1 and implies that it is an applicable guide for the soil-to-indoor air pathway. As noted in the table footnote, this table provides a list of required analyses for groundwater and soil media only (not soil vapor/soil gas).	Model Toxics Control Act (MTCA) Table 830-1 is the appropriate regulatory source to determine soil gas analytes for this investigation of total petroleum hydrocarbons in the gasoline range (TPH-G) for the following reasons: • WAC 173-340-750(3)(b)(ii)(C) specifies that Table 830-1 should be used to determine analytes for air quality investigations of petroleum products. • The soil medium is the source of the TPH-G being evaluated during this investigation. • The Table 830-1 analyte list for TPH-G includes all of the primary components of gasoline.
2	Ecology agrees with the Port's addition of n-hexane, 1,2-dibromoethane (ethylene dibromide), 1,2-dichloroethane (ethylene dichloride), methyl tertiary-butyl ether, naphthalene, 1,3,5-trimethylbenzene and 1,2,4-trimethylbenzene to the analyses list. We also agree with the Port's response to not analyze for the entire list of EPA Method TO-15 constituents, provided that 1,3-butadiene and chloromethane are also added to the constituent list.	Thank you for agreeing with the proposed approach of focusing the analyte list on the gasoline-related constituents. However, the Port does not agree with Ecology's request to add 1,3-butadiene or chloromethane to the constituent list for the reasons described in Response #1 and because these constituents are not associated with gasoline (either as principal components or breakdown products). The lack of 1,3-butadiene and chloromethane in gasoline is documented in material safety data sheets (MSDSs) for various gasoline products (see the five representative gasoline MSDSs that are attached) and the following government information resources: • **1,3-Butadiene** – The United States National Library of Medicine (USNLM) Hazardous Substances Data Bank (HSDB) indicates 1,3-butadiene "is a product of incomplete combustion resulting from natural processes and human activity. It is also an industrial chemical used in the production of polymers, polybutadiene, styrene-butadiene rubbers and lattices, and nitrile-butadiene rubbers. 1,3-butadiene is also released in emissions from motor vehicles and tobacco smoke." Regarding vehicle emissions, the USNLM's Toxicology Bibliographic Information (TOXLINE) adds that 1,3-butadiene "enters the environment from exhaust emissions from gasoline- and diesel-powered vehicles, from non-transportation fuel combustion, from biomass combustion, and from industrial on-site uses. While 1,3-butadiene is not persistent, it is ubiquitous in the urban environment because of its widespread combustion sources. The highest atmospheric concentrations have been measured in air in cities and close to industrial sources." Note: A California Office of Environmental Health Hazard Assessment (OEHHA) toxicity summary document indicated 1,3-butadiene can be found in gasoline vapor. However, the reference provided in the OEHHA document for this assertion is the USNLM HSDB. Neither the USNLM HSDB nor USNLM TOXLINE indicate that 1,3-butadine is present in gasoline itself. Rather, 1,3-butadiene can be present in motor vehicle exhaust as a result of incomplete combustion and/or the presence of rubber and plastic products that contain 1,3-butadiene.

RESPONSE TO ECOLOGY COMMENTS
Ref: Ecology Letter to Port of Olympia dated March 14, 2013

Data Gap Work Plan for the Soil-to-Indoor Air Pathway at the East Bay Redevelopment Site

#	Comment	Response
		• **Chloromethane** – A 1998 United States Agency for Toxic Substances and Disease Registry (ATSDR) public health statement for chloromethane indicates that the primary historical use of chloromethane was as a refrigerant and that the primary current use is the production of silicones. That said, the ATSDR document indicates that "most of the chloromethane that is released to the environment (estimated at up to 99%) comes from natural sources. Chloromethane is always present in the air at very low levels. Most of the naturally occurring chloromethane comes from chemical reactions that occur in the oceans or from chemical reactions that occur when materials like grass, wood, charcoal, and coal are burned. It is also released to the air as a product of some plants or from rotting wood." It should also be noted that Section 3.1.3.2 of the 2009 draft Ecology vapor intrusion guidance strongly implies that only benzene, toluene, ethylbenzene, and xylenes (BTEX) need to be analyzed in soil gas when evaluating a TPH-G release. Thus, the Port's soil gas analyte list already goes above and beyond what is typically analyzed in this type of situation by including other gasoline-related constituents besides BTEX. Fire and Explosion Hazard Information

==========

Flash Point Method: TCC

Flash Point Text: -35F,-37C

Lower Limits: 1.4%

Upper Limits: 7.6%

Extinguishing Media: USE DRY CHEMICAL, ALCOHOL FOAM, ALL PURPOSE AFFF OR CARBON DIOXIDE TO EXTINGUISH FIRE.

Fire Fighting Procedures: USE NIOSH APPRVD SCBA & FULL PROT EQUIP (FP N). WATER MAY BE INEFTIVE BUT SHOULD BE USED TO COOL FIRE-EXPOS CNTNRS, STRUCTURES & TO PROTECT PERS. IF (SUPDAT)

Unusual Fire/Explosion Hazard: DANGEROUS WHEN EXPOS TO HEAT/FLAME. VAPS FORM FLAM/EXPLO MIXS W/AIR AT ROOM TEMP. VAP/GAS MAY SPREAD TO DISTANT IGNIT SOURCE & FLASH BACK. VAPS MAY CONC(SUPDAT)

==========

Control Measures

==========

Respiratory Protection: IF EXPOS LIMS ARE EXCEEDED OR IRRIT IS EXPERIENCED, NIOSH APPRVD RESP PROT SHOULD BE WORN. VENT & OTHER FORMS OF ENGINEERING CTS ARE OFTEN PREF MEANS FOR CONTROLLING CHEM EXPOS. RESP PROT MAY BE NEEDED FOR NON-ROUTINE OR EMER SITUATIONS.

Ventilation: NONE SPECIFIED BY MANUFACTURER.

Protective Gloves: IMPERVIOUS GLOVES.
Eye Protection: ANSI APPRVD CHEM WORKERS GOGGLES (FP N).
Other Protective Equipment: ANSI APPROVED EYE WASH & DELUGE SHOWER (FP N).
AVOID SKIN CONTACT. WEAR PROT CLTHG. DO NOT WEAR CNTCT LENSES.
Work Hygienic Practices: WASH HANDS IF IN CNTCT W/MATL. USE GOOD PERSONAL
HYGIENE. WEAR REGULARLY CLEANED WORK CLTHG. SHOWER & CHANGE AFTER WORK.
Supplemental Safety and Health: FIRE FIGHT PROC: LEAK/SPILL HAS NOT IGNITED,
VENT AREA & USE WATER SPRAY TO DISPERSE GAS/VAP & PROTECT PERS. USE
WATER TO DULUTE SPILLS & FLUSH THEM AWAY FROM IGNIT SOURCE. DO NOT FLUSH
DOWN PUBLIC SEWERS/OTHER DRAIN SYS. EXPLO HAZ: IN CONF INED AREAS. RUNOFF TO
SEWER MAY CAUSE FIRE/EXPLO HAZ. CNTNRS MAY

545 mg/m3 (125 ppm) STC MEXICAN

COMPONENT:Cyclohexane
CAS NO.: 110-82-7
% BY WT.: 0 - 1
EXPOSURE LIMITS:
1030 mg/m3 (300 ppm) TLV ACGIH
1050 mg/m3 (300 ppm) PEL OSHA
1050 mg/m3 (300 ppm) REL NIOSH
1300 ppm IDLH NIOSH (LEL)
1050 mg/m3 (300 ppm) TWA MEXICAN

The OSHA Permissible Exposure Limits listed above were promulgated by OSHA in 1989. This standard was vacated by the U.S. Court of Appeals for the Eleventh Circuit. Exposure limits defined in specific chemical standards found in 29 CFR 1910.1000-1048 are not covered by this ruling and are still enforceable.

========== HAZARDS IDENTIFICATION ==========

EMERGENCY OVERVIEW:

Clear Liquid With a Strong Hydrocarbon Odor.
Danger! Extremely Flammable Liquid and Vapors. Vapor May Cause Flash Fire. Harmful or Fatal If Swallowed. Aspiration Hazard If Swallowed--Can Enter Lungs and Cause Damage. Vapors May Be Harmful. May Be Irritating To the Skin, Eyes and Respiratory Tract. Overexposure May Cause Adverse Nervous System Effects. Long-Term Exposure To Vapors Has Caused Cancer In Some Laboratory Animals.

POTENTIAL HEALTH EFFECTS:

SKIN:

Repeated or prolonged contact may result in defatting, redness, itching, inflammation, cracking and possible secondary infection. High pressure skin injections are Serious Medical Emergencies. Injury may not appear serious at first; within a few hours, tissue will become swollen, discolored and extremely painful (see Notes to Physician section).

EYE:

May cause irritation, redness, pain, blurred vision, lacrimation and conjunctivitis. Exposure to vapors, fumes or mists may cause irritation. Contact with heated material may cause thermal burns.

INHALATION:

May cause respiratory tract irritation. Exposure may cause central

nervous system symptoms similar to those listed under "Ingestion" (see Ingestion section). May cause irregular heart rhythm. Repeated or prolonged exposures may cause behavioral changes.

INGESTION:

Aspiration into lungs may cause pneumonitis. May cause gastrointestinal disturbances. Symptoms may include irritation, nausea, vomiting and diarrhea. May cause harmful central nervous system effects. Effects may include excitation, euphoria, headache, dizziness, drowsiness, blurred vision, fatigue, tremors, convulsions, loss of consciousness, coma, respiratory arrest and death.

SPECIAL TOXIC EFFECTS:

May cause adverse liver and kidney effects based on tests with laboratory animals. A product of similar composition has been found to be carcinogenic to laboratory animals when given by inhalation. Also, a variety of mutagenicity assays have been conducted that have yielded conflicting results. IARC has determined that there is limited evidence for the carcinogenicity of gasoline in experimental animals and inadequate evidence for the carcinogenicity of gasoline in humans. (IARC Class- 2B). Warning: The use of any hydrocarbon fuel in an area without adequate ventilation may result in hazardous levels of combustion products and inadequate oxygen levels. IARC has determined that gasoline engine exhaust is possibly carcinogenic to humans. (IARC Class- 2B). This product contains benzene. Acute benzene poisoning causes central nervous system depression. Chronic exposure affects the hematopoietic system causing blood disorders including anemia and pancytopenia. Mutagenic and clastogenic in mammalian and non-mammalian test systems. Reproductive toxicant only at doses that are maternally toxic, based on tests with animals. May be absorbed through the skin. Benzene is carcinogenic to laboratory animals when given by intubation or by inhalation. Chronic exposure to high levels of benzene has been shown to cause cancer (certain forms of leukemia) in humans. Carcinogenic determination: IARC--Human and Animal sufficient evidence of carcinogenicity; (IARC Class--1); NTP--Known carcinogen; ACGIH--Suspected carcinogen. Solvent "sniffing" (abuse) or intentional prolonged overexposure to high levels of solvent vapors can produce abnormal behavior, convulsions, hallucinations, delirium, nervous system damage and sudden death. The major component of this product has been tested in a dermal carcinogenicity study and mutagenicity assays and was negative.

FIRST AID MEASURES

SKIN:

Remove contaminated clothing immediately. Wash area of contact thoroughly with soap and water. Get medical attention if irritation persists. Thermal burns require immediate medical attention. When burned from contact with hot material, flush skin immediately with large amounts of tepid or lukewarm water. If possible, submerge affected area in lukewarm water. Get immediate medical attention. High pressure skin injections are serious medical emergencies. Skin injections require immediate medical care.

EYE:

Flush immediately with large amounts of water for at least 15 minutes. Eyelids should be held away from the eyeball to ensure thorough rinsing. Get medical attention if irritation results. Thermal burns require immediate medical attention.

INHALATION:

Remove affected person from source of exposure. If not breathing, ensure clear airway and institute cardiopulmonary resuscitation (CPR). If breathing is difficult, administer oxygen if available. Continue to monitor closely. Get immediate medical attention.

INGESTION:

Do not induce vomiting because of danger of aspirating liquid into lungs. Get immediate medical attention. If spontaneous vomiting occurs, monitor for breathing difficulty.

NOTES TO PHYSICIAN:

Ingestion: The most important risk to assess is the extent of aspiration of the product into the lungs since an acute chemical pneumonitis can rapidly progress to respiratory failure. Gasping, coughing, and choking are presumptive evidence of aspiration. It is suggested that all patients suspected of hydrocarbon aspiration have base line chest x-rays. Immediate hospitalization should be considered for asymptomatic children with an abnormal chest x-ray, obtunded or hypoxic patients, intentional or massive ingestions, and patients with abnormal chest x-rays with clinically significant pulmonary disease. Monitor arterial blood gases, chest x-ray and pulmonary function tests in symptomatic patients (dyspnea, tachypea, wheezing, retractions, persistent coughing). Monitor complete blood count, urinalysis, and liver and kidney function test in patients with significant exposure. Monitor fluids and electrolytes. Do not induce emesis. Gentle, cautious gastric lavage may be indicated if performed soon after ingestion, or in patients who are comatose or at risk of convulsing. Protect airway by placement in Trendelenburg and left lateral decubitus position or by cuffed endotracheal tube (adults). Administer activated charcoal slurry, aqueous or mixed with saline cathartic or sorbitol. Observe patients with ingestion carefully for the possible development of esophageal or gastrointestinal tract irritation or burns. If signs or symptoms of esophageal irritation or burns are present, consider endoscopy to determine the extent of injury. Hydrocarbons may increase the sensitivity of the myocardium to catecholamines; electrocardiographic monitoring may be indicated and careful consideration should be given to the selection of bronchodilators. Hydrocarbons may sensitize the myocardium, therefore epinephrine and other stimulants which may cause arrhythmias should be avoided. Acute central nervous system signs and symptoms may result from large ingestions or aspiration-induced hypoxia. Inhalation Abuse: Gasoline is one of the solvents used by chemical substance abusers. These patients may present with acute and/or chronic central nervous system signs or symptoms. They may also present with arrhythmias. In case of skin injection, consider prompt debridement of the wound to minimize

necrosis and tissue loss.

========== FIREFIGHTING MEASURES ==========

FLASH POINT: -37 C (-34.6 F) TCC
AUTOIGNITION TEMPERATURE: 444 C (831.2 F)
FLAMMABILITY LIMITS IN AIR (% BY VOL.) LOWER: > 1.4
FLAMMABILITY LIMITS IN AIR (% BY VOL.) UPPER: < 7.6

HAZARDOUS COMBUSTION PRODUCTS:

Combustion may produce CO, CO2 and reactive hydrocarbons.

BASIC FIRE FIGHTING PROCEDURES:

Use dry chemical, foam or carbon dioxide to extinguish fire. Water may be ineffective but should be used to cool fire-exposed containers, structures and to protect personnel. If leak or spill has not ignited, ventilate area and use water spray to disperse gas or vapor and to protect personnel attempting to stop leak. Use water to flush spills away from sources of ignition. Do not flush down public sewers or other drainage systems. Exposed firefighters must wear MSHA/NIOSH approved positive pressure self-contained breathing apparatus with full face mask and full protective clothing.

UNUSUAL FIRE & EXPLOSION HAZARDS:

Dangerous when exposed to heat or flame. Vapors form flammable or explosive mixtures with air at room temperature. Vapor or gas may spread to distant ignition sources and flash back. Vapors may concentrate in confined areas. Vapors or gas may accumulate in low areas. Runoff to sewer may cause fire or explosion hazard. Containers may explode in heat of fire. Irritating and/or toxic substances may be emitted upon thermal decomposition.

========== ACCIDENTAL RELEASE MEASURES ==========

If your facility or operation has an "Oil or Hazardous Substance Contingency Plan", activate its procedures. Take immediate steps to stop and contain the spill. Caution should be exercised regarding personnel safety and exposure to the spilled material. For technical advice and assistance related to chemicals, contact CHEMTREC (800/424-9300) and your local fire department. Notify the National Response Center, if required. Also notify appropriate state and local regulatory agencies, the LEPC and the SERC. Contact the local Coast Guard if the release is into a waterway. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. (Also see Personal Protection Information section.)
Isolate for 1/2 mile in all directions if tank, rail car or tank truck is involved in fire.
Shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do it without risk. Water spray may reduce vapor; but it may not prevent ignition in closed spaces. Small Spills: Take up with sand or other noncombustible absorbent material and place into containers for later disposal. Large Spills: Dike far ahead of liquid spill for later disposal.

When reporting a spill to the National Response Center or the Coast Guard, you may need to supply the Coast Guard Chemical Hazard Response Information System (CHRIS) code:

Group Number: 33
CHRIS Code: GAT

Additional spill related information may be found in the U.S. Coast Guard Chemical Hazard Response Information System (CHRIS) Manual.

During an accidental release, personal protection equipment may be required (see Section EXPOSURE CONTROLS/PERSONAL PROTECTION). Additional regulatory requirements may apply (see Section REGULATORY INFORMATION).

========== HANDLING AND STORAGE ==========

HANDLING:

Use only with adequate ventilation. Keep containers closed. Use non-sparking tools. Ground lines and equipment used during transfer to reduce the possibility of static spark-initiated fire or explosion. Static electricity may ignite gasoline vapors when filling portable containers. Place the container on the ground before filling. Keep the nozzle in contact with the container during filling. Do not fill any portable container in or on a vehicle or marine craft. Use good personal hygiene practices. Wash hands before eating, drinking, smoking, or using toilet facilities. Remove contaminated clothing and clean before reuse. Wash thoroughly after work using soap and water. Do not siphon this product by mouth. Use only as a motor fuel. Do not use for cleaning, pressure appliance fuel, or any other use. Keep out of reach of children.

Empty containers may contain toxic, flammable/combustible or explosive residue or vapors. Do not cut, grind, drill, weld, reuse or dispose containers unless adequate precautions are taken against these hazards.

STORAGE:

Store gasoline only in approved, clearly labeled containers. Never store in glass or unapproved plastic containers. Store in tightly closed containers in cool, dry, isolated, well-ventilated area away from heat, sources of ignition and incompatibles.

========== EXPOSURE CONTROLS / PERSONAL PROTECTION ==========

ENGINEERING CONTROLS:

Ventilation and other forms of engineering controls are often the preferred means for controlling chemical exposures.

PERSONAL PROTECTION EQUIPMENT (PPE):

EYE PROTECTION:

Avoid eye contact with this material. Wear safety glasses or chemical

goggles. Provide an eyewash station immediately accessible to the work area. Do not wear contact lenses when working with this substance.

SKIN PROTECTION:

Avoid skin contact. If skin contact is anticipated, protective clothing, including impervious gloves, should be worn. Wash hands if they come in contact with this material. Use good personal hygiene. Wear regularly cleaned work clothing. Showering and changing into street clothing after work is desirable. Product spilt on clothing may result in delayed evaporation and a subsequent fire hazard. Wash contaminated clothing separately. If clothing is to be laundered by someone else, inform launderer of proper procedures.

RESPIRATORY PROTECTION:

If exposure limits are exceeded or if irritation is experienced, NIOSH approved respiratory protection should be worn. Respiratory protection may be needed for non-routine or emergency situations.

See Section COMPOSITION/INFORMATION ON INGREDIENTS For Exposure Guidelines.

PHYSICAL AND CHEMICAL PROPERTIES

BOILING POINT:	26.6667 C (80 F) - 226.6667 C (440 F)
SP. GRAVITY (Water=1):	0.72 - 0.74 @ 15.56 C (60.008 F)
MELTING POINT:	NA
% VOLATILE:	100 @ 225 C (437 F)
VAPOR PRESSURE:	760 MM HG @ 37.8 C (100.04 F)
EVAPORATION RATE:	> 1
VAPOR DENSITY (Air=1):	1.2 as vapor
VISCOSITY:	ND
% SOLUBILITY IN WATER:	Negligible
POUR POINT:	ND
pH:	ND
BULK DENSITY:	ND
MOLECULAR WEIGHT:	Mixture
MOLECULAR FORMULA:	Mixture

ODOR/APPEARANCE:

Clear Liquid With a Strong Hydrocarbon Odor.

STABILITY AND REACTIVITY

STABILITY/INCOMPATIBILITY:

Stable under conditions of normal use. Avoid contact with strong oxidizers.

HAZARDOUS REACTIONS/DECOMPOSITION PRODUCTS:

Thermal decomposition or combustion may produce CO, CO2 and reactive hydrocarbons.

TOXICOLOGICAL INFORMATION

OTHER:

An extensive profile which characterizes adverse health effects information for this material has been prepared by the Agency for Toxic Substances Disease Registry (ATSDR). Individuals interested in a summary of the toxicology of this material should reference this document.

========== DISPOSAL CONSIDERATIONS ==========

WASTE DISPOSAL (Resource Conservation & Recovery Act - RCRA):

This material, when discarded or disposed of, is a characteristic hazardous waste according to Federal regulations (40 CFR 261). This material exhibits the characteristic of ignitability and is assigned the EPA Hazardous Waste Number of D001. The discarding or disposal of this material must be done at a properly permitted facility in accordance with the regulations of 40 CFR 262, 263, 264, and 268. Additionally, the discarding or disposal of this material may be further regulated by state, regional, or local regulations. Chemical additions, processing or otherwise altering this material may make the waste management information presented in this MSDS incomplete, inaccurate, or otherwise inappropriate. The transportation, storage, treatment and disposal of this waste material must be conducted in compliance with all applicable Federal, state, and local regulations.

There may be specific current regulations at the local, regional, or state level that pertain to this information. Chemical additions, processing, or otherwise altering this material may make the waste management information presented in this MSDS, incomplete, inaccurate, or otherwise inappropriate.

========== TRANSPORT INFORMATION ==========

U.S. DEPARTMENT OF TRANSPORTATION (D.O.T.):

Proper Shipping Name (49 CFR 172.101):	Gasoline
Hazard Class (49 CFR 172.101):	3
UN/NA Code (49 CFR 172.101):	UN 1203
Packing Group (49 CFR 179.101):	PG II
Bill Of Lading Desc. (49 CFR 172.101):	Gasoline, 3, UN 1203, PG II
Labels Required (49 CFR 172.101):	Flammable Liquid
Placards Required (49 CFR 172.101):	Flammable Liquid

INTERNATIONAL AND DOMESTIC AIR TRANSPORTATION:

IATA Proper Shipping Name:	Gasoline
Hazard Class:	3
Subsidiary Risk:	NA
UN Code:	UN 1203
Package Specification:	305, 307
Labels Required:	Flammable Liquid, Orientation Arrows

INTERNATIONAL WATER TRANSPORTATION:

IMDG Proper Shipping Name:	Gasoline
Hazard Class:	3.1
UN Code:	UN 1204
IMDG Page Number:	3141
Labels Required:	Flammable Liquid
Placards Required:	Flammable

CANADIAN TRANSPORTATION OF DANGEROUS GOODS (T.D.G.):

Shipping Name:	Gasoline
PIN (UN/NA):	UN 1203
Regulated Class:	3
Division:	None
Packaging Group:	PG II
Labels Required:	Flammable Liquid
Placards Required:	Flammable

REGULATORY INFORMATION

NOTIFICATION:

Clean Water Act (Oil Spills): Any spill or release, or substantial threat of release, of this material to navigable water (virtually any surface water) sufficient to cause a visible sheen upon the water must be reported immediately to the National Response Center (800/424-8802), as required by U.S. Federal Law. Failure to report may result in substantial civil and criminal penalties. Also contact the Coast Guard and appropriate state and local regulatory agencies. CERCLA/SARA (Chemical Spills): The reportable quantity for this material is 333 * pound(s). This material contains one or more constituents regulated as hazardous substances under U.S. Federal Law. Any spill or other release, or substantial threat of release, of this material to the air, water or land (unless entirely contained in the workplace) equal to or in excess of the reportable quantity must be reported immediately to the National Response Center (800/424-8802). Also contact appropriate state and local regulatory agencies. Contact the Coast Guard if spilled into navigable waterways under their jurisdiction. Failure to report may result in substantial civil and criminal penalties. * Calculated on the basis for whichever hazardous component provides the lowest value for: RQ / % in mixture

CLEAN WATER ACT:

This material contains a mixture of substances, some of which are listed as toxic pollutants pursuant to 40 CFR 122.21, Appendix D, Tables II/III/V. Any unusual introduction of this substance into the facility's process streams, stormwater and/or wastewater could result in the violation of U.S. Federal Law. Facilities must notify the USEPA as soon as they know, or have reason to believe, that any activity has occurred, or will occur, which would result in the discharge of a toxic pollutant which is not regulated in the facility's NPDES permit. Notification levels are described in 40 CFR 122.42(a)(1) and 122.42(a)(2). Refer to spill section for additional regulatory requirements.

CLEAN AIR ACT:

This material contains a substance listed as a hazardous air pollutant under U.S. Federal regulations. See 40 CFR Part 61 for restrictions which may apply to its use.

US EPA TOXIC SUBSTANCE CONTROL ACT (TSCA):

This product contains 1,2,4-Trimethylbenzene and is subject to EPA TSCA Section 12(b) Export Notification Regulation.

US EPA SUPERFUND AMENDMENTS & REAUTHORIZATION ACT (SARA) TITLE III INFORMATION:

Listed below are the hazard catagories for SARA Section 311/312 (40 CFR 370):

Immediate Hazard:	X
Delayed Hazard:	X
Fire Hazard:	X
Pressure Hazard:	-
Reactivity Hazard:	-

This product contains the following toxic chemicals subject to the annual toxic chemical release reporting requirements of SARA Section 313 (40 CFR 372):

COMPONENT:	CAS NO.:	% BY WT.:
Xylene	1330-20-7	10
Toluene	108-88-3	7
1,2,4-Trimethylbenzene	95-63-6	3
Benzene	71-43-2	2
Ethylbenzene	100-41-4	2
Cyclohexane	110-82-7	1

OCCUPATIONAL SAFETY & HEALTH ADMINISTRATION (OSHA):

Contains Benzene. Consult OSHA Standard 1910 1028. Initial air monitoring should be conducted to determine if exposures are above 0.5 ppm action limit or 1 ppm PEL. If exposures are above, OSHA requirements apply for training, medical surveillance, personal/protective equipment, regulated areas, etc.

CANADIAN ENVIRONMENTAL PROTECTION ACT (CEPA):

All components of this product are listed on the Canadian DSL or NDSL inventories.

CANADIAN WORKPLACE HAZARDOUS MATERIALS INFORMATION SYSTEM (WHMIS) CATEGORIES:

The following WHMIS categories apply to this product:

Compressed Gas:	-	Other Toxic Effects:	X
Flammable/Combustible:	X	Bio Hazardous:	-
Oxidizer:	-	Corrosive:	-
Acutely Toxic:	X	Dangerously Reactive:	-

STATE REGULATIONS:

This product contains ingredient(s) known to the State of California to cause cancer, birth defects or other reproductive harm.

- REGULATORY INFORMATION
- OTHER INFORMATION

NOTICE: The information presented herein is based on data considered to be accurate as of the date of preparation of this Material Safety Data Sheet. However, no warranty or representation, express or implied, is made as to the accuracy or completeness of the foregoing data and safety information, nor is any authorization given or implied to practice any patented invention without a license. In addition, no responsibility can be assumed by vendor for any damage or injury resulting from abnormal use, from any failure to adhere to recommended practices, or from any hazards inherent in the nature of the product.

ND: No Data NA: Not Applicable *See specific note or section

Material Safety Data Sheet

SECTION 1 PRODUCT AND COMPANY IDENTIFICATION

CHEVRON and TEXACO MID-GRADE UNLEADED GASOLINES

Product Use: Fuel
Product Number(s): CPS201001 [See Section 16 for Additional Product Numbers]
Synonyms: Calco Mid-Grade Unleaded Gasoline, Chevron Mid-Grade Unleaded Gasoline, Chevron Plus Unleaded Gasoline, Texaco Power Plus Gasoline
Company Identification
Chevron Products Company
Marketing, MSDS Coordinator
6001 Bollinger Canyon Road
San Ramon, CA 94583
United States of America

Transportation Emergency Response
CHEMTREC: (800) 424-9300 or (703) 527-3887
Health Emergency
Chevron Emergency Information Center: Located in the USA. International collect calls accepted. (800) 231-0623 or (510) 231-0623
Product Information
MSDS Requests: http://www.chevron.com/contact
Technical Information: (510) 242-5357

SPECIAL NOTES: This MSDS applies to: all motor gasoline.

SECTION 2 HAZARDS IDENTIFICATION

****

EMERGENCY OVERVIEW

- EXTREMELY FLAMMABLE LIQUID AND VAPOR. VAPOR MAY CAUSE FLASH FIRE
- CAUSES SKIN IRRITATION
- HARMFUL OR FATAL IF SWALLOWED - MAY CAUSE LUNG DAMAGE IF SWALLOWED
- MAY CAUSE DIZZINESS, DROWSINESS AND REDUCED ALERTNESS
- VAPOR HARMFUL
- MAY CAUSE CANCER BASED ON ANIMAL DATA
- KEEP OUT OF REACH OF CHILDREN
- MAY CAUSE RESPIRATORY TRACT IRRITATION IF INHALED
- TOXIC TO AQUATIC ORGANISMS. MAY CAUSE LONG-TERM ADVERSE EFFECTS IN THE AQUATIC ENVIRONMENT

****

IMMEDIATE HEALTH EFFECTS

Eye: Not expected to cause prolonged or significant eye irritation.

Skin: Contact with the skin causes irritation. Skin contact may cause drying or defatting of the skin. Symptoms may include pain, itching, discoloration, swelling, and blistering. Contact with the skin is not expected to cause an allergic skin response. Not expected to be harmful to internal organs if absorbed through the skin.

Ingestion: Because of its low viscosity, this material can directly enter the lungs, if swallowed, or if subsequently vomited. Once in the lungs it is very difficult to remove and can cause severe injury or death.

Inhalation: The vapor or fumes from this material may cause respiratory irritation. Symptoms of respiratory irritation may include coughing and difficulty breathing. Excessive or prolonged breathing of this material may cause central nervous system effects. Central nervous system effects may include headache, dizziness, nausea, vomiting, weakness, loss of coordination, blurred vision, drowsiness, confusion, or disorientation. At extreme exposures, central nervous system effects may include respiratory depression, tremors or convulsions, loss of consciousness, coma or death.

DELAYED OR OTHER HEALTH EFFECTS:

Reproduction and Birth Defects: This material is not expected to cause birth defects or other harm to the developing fetus based on animal data.

Cancer: Prolonged or repeated exposure to this material may cause cancer. Contains naphthalene, which has been classified as a Group 2B carcinogen (possibly carcinogenic to humans) by the International Agency for Research on Cancer (IARC). Gasoline has been classified as a Group 2B carcinogen (possibly carcinogenic to humans) by the International Agency for Research on Cancer (IARC).

Contains benzene, which has been classified as a carcinogen by the National Toxicology Program (NTP) and a Group 1 carcinogen (carcinogenic to humans) by the International Agency for Research on Cancer (IARC).

Contains ethylbenzene which has been classified as a Group 2B carcinogen (possibly carcinogenic to humans) by the International Agency for Research on Cancer (IARC).

Whole gasoline exhaust has been classified as a Group 2B carcinogen (possibly carcinogenic to humans) by the International Agency for Research on Cancer (IARC).

Contains benzene, which has been classified as an A1 Group Confirmed Human Carcinogen by the American Conference of Governmental Industrial Hygienists (ACGIH).

See Section 11 for additional information. Risk depends on duration and level of exposure.

SECTION 3 COMPOSITION/ INFORMATION ON INGREDIENTS

COMPONENTS	CAS NUMBER	AMOUNT
Gasoline	86290-81-5	100 %vol/vol
Benzene	71-43-2	0.1 - 4.9 %vol/vol
Toluene (methylbenzene)	108-88-3	1 - 25 %vol/vol
Ethyl benzene	100-41-4	0.1 - 3 %vol/vol
Xylene (contains o-, m-, & p- xylene isomers in varying amounts)	1330-20-7	1 - 15 %vol/vol
Butane	106-97-8	1 - 12 %vol/vol
Heptane	142-82-5	1 - 4 %vol/vol
Hexane	110-54-3	1 - 5 %vol/vol
Cyclohexane	110-82-7	1 - 3 %vol/vol
Methylcyclohexane	108-87-2	1 - 2 %vol/vol
Pentane, 2,2,4-trimethyl- (Isooctane)	540-84-1	1 - 13 %vol/vol

Naphthalene	91-20-3	0.1 - 2 %vol/vol
Ethanol	64-17-5	0 - 10 %vol/vol
Methyl tert-butyl ether (MTBE)	1634-04-4	<= 0.1 %vol/vol

Information on ingredients that are considered Controlled Products and/or that appear on the WHMIS Ingredient Disclosure List (IDL) is provided as required by the Canadian Hazardous Products Act (HPA, Sections 13 and 14). Ingredients considered hazardous under the OSHA Hazard Communication Standard, 29 CFR 1910.1200, are also listed. See Section 15 for additional regulatory information.

SECTION 4 FIRST AID MEASURES

Eye: No specific first aid measures are required. As a precaution, remove contact lenses, if worn, and flush eyes with water.
Skin: Wash skin with water immediately and remove contaminated clothing and shoes. Get medical attention if any symptoms develop. To remove the material from skin, use soap and water. Discard contaminated clothing and shoes or thoroughly clean before reuse.
Ingestion: If swallowed, get immediate medical attention. Do not induce vomiting. Never give anything by mouth to an unconscious person.
Inhalation: Move the exposed person to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention if breathing difficulties continue or if any other symptoms develop.
Note to Physicians: Ingestion of this product or subsequent vomiting may result in aspiration of light hydrocarbon liquid, which may cause pneumonitis.

SECTION 5 FIRE FIGHTING MEASURES

See Section 7 for proper handling and storage.

FLAMMABLE PROPERTIES:
Flashpoint: (Tagliabue Closed Cup ASTM D56) < -45 °C (< -49 °F)
Autoignition: > 280 °C (> 536 °F)
Flammability (Explosive) Limits (% by volume in air): Lower: 1.4 Upper: 7.6 (Typical)

EXTINGUISHING MEDIA: Dry Chemical, CO2, AFFF Foam or alcohol resistant foam if >15% volume polar solvents (oxygenates).

PROTECTION OF FIRE FIGHTERS:
Fire Fighting Instructions: Use water spray to cool fire-exposed containers and to protect personnel. For fires involving this material, do not enter any enclosed or confined fire space without proper protective equipment, including self-contained breathing apparatus.
Combustion Products: Highly dependent on combustion conditions. A complex mixture of airborne solids, liquids, and gases including carbon monoxide, carbon dioxide, and unidentified organic compounds will be evolved when this material undergoes combustion.

SECTION 6 ACCIDENTAL RELEASE MEASURES

Protective Measures: Eliminate all sources of ignition in the vicinity of the spill or released vapor. If this

material is released into the work area, evacuate the area immediately. Monitor area with combustible gas indicator.
Spill Management: Stop the source of the release if you can do it without risk. Contain release to prevent further contamination of soil, surface water or groundwater. Clean up spill as soon as possible, observing precautions in Exposure Controls/Personal Protection. Use appropriate techniques such as applying non-combustible absorbent materials or pumping. All equipment used when handling the product must be grounded. A vapor suppressing foam may be used to reduce vapors. Use clean non-sparking tools to collect absorbed material. Where feasible and appropriate, remove contaminated soil. Place contaminated materials in disposable containers and dispose of in a manner consistent with applicable regulations.
Reporting: Report spills to local authorities as appropriate or required.

SECTION 7 HANDLING AND STORAGE

Precautionary Measures: Do not get in eyes, on skin, or on clothing. This product presents an extreme fire hazard. Liquid very quickly evaporates, even at low temperatures, and forms vapor (fumes) which can catch fire and burn with explosive violence. Invisible vapor spreads easily and can be set on fire by many sources such as pilot lights, welding equipment, and electrical motors and switches. Do not taste or swallow. Do not breathe vapor or fumes. Never siphon gasoline by mouth.
Do not store in open or unlabeled containers. READ AND OBSERVE ALL PRECAUTIONS ON PRODUCT LABEL. Keep out of the reach of children. Wash thoroughly after handling.
General Handling Information: Avoid contaminating soil or releasing this material into sewage and drainage systems and bodies of water.
Static Hazard: Electrostatic charge may accumulate and create a hazardous condition when handling this material. To minimize this hazard, bonding and grounding may be necessary but may not, by themselves, be sufficient. Review all operations which have the potential of generating and accumulating an electrostatic charge and/or a flammable atmosphere (including tank and container filling, splash filling, tank cleaning, sampling, gauging, switch loading, filtering, mixing, agitation, and vacuum truck operations) and use appropriate mitigating procedures. For more information, refer to OSHA Standard 29 CFR 1910.106, 'Flammable and Combustible Liquids', National Fire Protection Association (NFPA 77, 'Recommended Practice on Static Electricity', and/or the American Petroleum Institute (API) Recommended Practice 2003, 'Protection Against Ignitions Arising Out of Static, Lightning, and Stray Currents'. Improper filling of portable gasoline containers creates danger of fire. Only dispense gasoline into approved and properly labeled gasoline containers. Always place portable containers on the ground. Be sure pump nozzle is in contact with the container while filling. Do not use a nozzle's lock-open device. Do not fill portable containers that are inside a vehicle or truck/trailer bed.

General Storage Information: DO NOT USE OR STORE near heat, sparks, flames, or hot surfaces . USE AND STORE ONLY IN WELL VENTILATED AREA. Keep container closed when not in use.
Container Warnings: Container is not designed to contain pressure. Do not use pressure to empty container or it may rupture with explosive force. Empty containers retain product residue (solid, liquid, and/or vapor) and can be dangerous. Do not pressurize, cut, weld, braze, solder, drill, grind, or expose such containers to heat, flame, sparks, static electricity, or other sources of ignition. They may explode and cause injury or death. Empty containers should be completely drained, properly closed, and promptly returned to a drum reconditioner or disposed of properly.

SECTION 8 EXPOSURE CONTROLS/PERSONAL PROTECTION

GENERAL CONSIDERATIONS:
Consider the potential hazards of this material (see Section 2), applicable exposure limits, job activities, and other substances in the work place when designing engineering controls and selecting personal

protective equipment. If engineering controls or work practices are not adequate to prevent exposure to harmful levels of this material, the personal protective equipment listed below is recommended. The user should read and understand all instructions and limitations supplied with the equipment since protection is usually provided for a limited time or under certain circumstances.

ENGINEERING CONTROLS:
Use process enclosures, local exhaust ventilation, or other engineering controls to control airborne levels below the recommended exposure limits.

PERSONAL PROTECTIVE EQUIPMENT
Eye/Face Protection: No special eye protection is normally required. Where splashing is possible, wear safety glasses with side shields as a good safety practice.
Skin Protection: Wear protective clothing to prevent skin contact. Selection of protective clothing may include gloves, apron, boots, and complete facial protection depending on operations conducted. Suggested materials for protective gloves include: Chlorinated Polyethylene (or Chlorosulfonated Polyethylene), Nitrile Rubber, Polyurethane, Viton.
Respiratory Protection: Determine if airborne concentrations are below the recommended occupational exposure limits for jurisdiction of use. If airborne concentrations are above the acceptable limits, wear an approved respirator that provides adequate protection from this material, such as: Air-Purifying Respirator for Organic Vapors.
When used as a fuel, this material can produce carbon monoxide in the exhaust. Determine if airborne concentrations are below the occupational exposure limit for carbon monoxide. If not, wear an approved positive-pressure air-supplying respirator.
Use a positive pressure air-supplying respirator in circumstances where air-purifying respirators may not provide adequate protection.
Occupational Exposure Limits:

Component	Country/ Agency	TWA	STEL	Ceiling	Notation
Benzene	ACGIH	.5 ppm (weight)	2.5 ppm (weight)	--	Skin A1 Skin
Benzene	CVX	1 ppm (weight)	5 ppm (weight)	--	--
Butane	ACGIH	1000 ppm (weight)	--	--	--
Cyclohexane	ACGIH	100 ppm (weight)	--	--	--
Ethanol	ACGIH	1000 ppm (weight)	--	--	A4
Ethyl benzene	ACGIH	100 ppm (weight)	125 ppm (weight)	--	A3
Gasoline	ACGIH	300 ppm (weight)	500 ppm (weight)	--	A3
Heptane	ACGIH	400 ppm (weight)	500 ppm (weight)	--	--
Hexane	ACGIH	50 ppm (weight)	--	--	Skin
Methyl tert-butyl ether (MTBE)	ACGIH	50 ppm (weight)	--	--	A3
Methyl tert-butyl ether (MTBE)	CVX	--	50 ppm	--	--
Methylcyclohexane	ACGIH	400 ppm	--	--	--

		(weight)			
Naphthalene	ACGIH	10 ppm (weight)	15 ppm (weight)	--	Skin
Pentane, 2,2,4-trimethyl- (Isooctane)	ACGIH	300 ppm (weight)	--	--	--
Toluene (methylbenzene)	ACGIH	50 ppm (weight)	--	--	Skin A4
Xylene (contains o-, m-, & p- xylene isomers in varying amounts)	ACGIH	100 ppm (weight)	150 ppm (weight)	--	A4

NOTE ON OCCUPATIONAL EXPOSURE LIMITS: Consult local authorities for acceptable provincial values in Canada. Consult the Canadian Standards Association Standard 94.4-2002 Selection, Use and Care of Respirators.

SECTION 9 PHYSICAL AND CHEMICAL PROPERTIES

Attention: the data below are typical values and do not constitute a specification.

Color: Colorless to yellow
Physical State: Liquid
Odor: Petroleum odor
pH: Not Applicable
Vapor Pressure: 5 psi - 15 psi (Typical) @ 37.8 °C (100 °F)
Vapor Density (Air = 1): 3 - 4 (Typical)
Boiling Point: 37.8°C (100°F) - 204.4°C (400°F) (Typical)
Solubility: Insoluble in water; miscible with most organic solvents.
Freezing Point: Not Applicable
Melting Point: Not Applicable
Specific Gravity: 0.7 g/ml - 0.8 g/ml @ 15.6°C (60.1°F) (Typical)
Viscosity: <1 SUS @ 37.8°C (100°F)
Evaporation Rate: No data available
Odor Threshold: No data available
Coefficient of Water/Oil Distribution: No data available

SECTION 10 STABILITY AND REACTIVITY

Chemical Stability: This material is considered stable under normal ambient and anticipated storage and handling conditions of temperature and pressure.
Incompatibility With Other Materials: May react with strong acids or strong oxidizing agents, such as chlorates, nitrates, peroxides, etc.
Hazardous Decomposition Products: None known (None expected)
Hazardous Polymerization: Hazardous polymerization will not occur.
Sensitivity to Mechanical Impact: No.

SECTION 11 TOXICOLOGICAL INFORMATION

IMMEDIATE HEALTH EFFECTS
Eye Irritation: The eye irritation hazard is based on evaluation of data for similar materials or product components.
Skin Irritation: For a 4-hour exposure, the Primary Irritation Index (PII) in rabbits is: 4.8/8.0.
Skin Sensitization: This material did not cause skin sensitization reactions in a Buehler guinea pig test.

Acute Dermal Toxicity: LD50: >3.75g/kg (rabbit).
Acute Oral Toxicity: LD50: >5 ml/kg (rat)
Acute Inhalation Toxicity: 4 hour(s) LD50: >20000mg/m3 (rat). For additional information on the acute toxicity of the components, call the technical information center.**Subchronic Effects:** Exposure of rats for 13 weeks (6 hr/day for 5 days/week) to the light ends of gasoline (up to 20,000 mg/m3) resulted in minimal responses of toxicity. There were no indications of neurotoxicity based morphological, functional and biochemical indices. There was also no evidence of immunotoxicity in the rats. However, when rats were exposed to gasoline vapor containing ethanol up to 20,000 mg/m3 there was evidence of both humoral immune suppression and mild astrogliosis. **Reproduction and Birth Defects:** Exposure of rats to the light ends of gasoline at up to 20,000 mg/m3 had generally no impact upon reproductive abilities and did not cause birth defects. **Genetic Toxicity:** Gasoline was not mutagenic, with or without activation, in the Ames assay (Salmonella typhimurium), Saccharamyces cerevisesae, or mouse lymphoma assays. In addition, point mutations were not induced in human lymphocytes. Gasoline was not mutagenic when tested in the mouse dominant lethal assay. Administration of gasoline to rats did not cause chromosomal aberrations in their bone marrow cells. Inhalation exposure of rats to the light ends of gasoline caused increased sister chromatid exchange in their peripheral white blood cells but did not cause an increase in micronucleated red blood cells in their bone marrow.

ADDITIONAL TOXICOLOGY INFORMATION:

Gasolines are highly volatile and can produce significant concentrations of vapor at ambient temperatures. Gasoline vapor is heavier than air and at high concentrations may accumulate in confined spaces to present both safety and health hazards. When vapor exposures are low, or short duration and infrequent, such as during refueling and tanker loading/unloading, neither total hydrocarbon nor components such as benzene are likely to result in any adverse health effects. In situations such as accidents or spills where exposure to gasoline vapor is potentially high, attention should be paid to potential toxic effects of specific components. Information about specific components in gasoline can be found in Sections 2/3, 8 and 15 of this MSDS. More detailed information on the health hazard of specific gasoline components can be obtained calling the Chevron Emergency Information Center (see Section 1 for phone numbers).

Pathological misuse of solvents and gasoline, involving repeated and prolonged exposure to high concentrations of vapor is a significant exposure on which there are many reports in the medical literature. As with other solvents, persistent abuse involving repeated and prolonged exposures to high concentrations of vapor has been reported to result in central nervous system damage and eventually, death. In a study in which ten human volunteers were exposed for 30 minutes to approximately 200, 500 or 1000 ppm concentrations of gasoline vapor, irritation of the eyes was the only significant effect observed, based on both subjective and objective assessments.

Lifetime inhalation of wholly vaporized unleaded gasoline at 2056 ppm has caused increased liver tumors in female mice and kidney cancer in male rats. In their 1988 review of carcinogenic risk from gasoline, The International Agency for Research on Cancer (IARC) noted that, because published epidemiology studies did not include any exposure data, only occupations where gasoline exposure may have occurred were reviewed. These included gasoline service station attendants and automobile mechanics. IARC also noted that there was no opportunity to separate effects of combustion products from those of gasoline itself. Although IARC allocated gasoline a final overall classification of Group 2B, i.e. possibly carcinogenic to humans, this was based on limited evidence in experimental animals plus supporting evidence including the presence in gasoline of benzene. The actual evidence for carcinogenicity in humans was considered inadequate.

To explore the health effects of workers potentially exposed to gasoline vapors in the marketing and distribution sectors of the petroleum industry, the American Petroleum Institute sponsored a cohort mortality study (Publication 4555), a nested case-control study (Publication 4551), and an exposure assessment study (Publication 4552). Histories of exposure to gasoline were reconstructed for cohort of more than 18,000 employees from four companies for the time period between 1946 and 1985. The results of the cohort mortality study indicated that there was no increased mortality from either kidney cancer or leukemia among marketing and marine distribution employees who were exposed to gasoline in the petroleum industry, when compared to the general population. More importantly, based on internal

comparisons, there was no association between mortality from kidney cancer or leukemia and various indices of gasoline exposure. In particular, neither duration of employment, duration of exposure, age at first exposure, year of first exposure, job category, cumulative exposure, frequency of peak exposure, nor average intensity of exposure had any effect on kidney cancer or leukemia mortality. The results of the nested case-control study confirmed the findings of the original cohort study. That is, exposure to gasoline at the levels experienced by this cohort of distribution workers is not a significant risk factor for leukemia (all cell types), acute myeloid leukemia, kidney cancer or multiple myeloma.

SECTION 12 ECOLOGICAL INFORMATION

ECOTOXICITY
96 hour(s) LC50: 2.7 mg/l (Oncorhynchus mykiss)
48 hour(s) LC50: 3.0 mg/l (Daphnia magna)
96 hour(s) LC50: 8.3 mg/l (Cyprinodon variegatus)
96 hour(s) LC50: 1.8 mg/l (Mysidopsis bahia)
This material is expected to be toxic to aquatic organisms and may cause long-term adverse effects in the aquatic environment. Gasoline studies have been conducted in the laboratory under a variety of test conditions with a range of fish and invertebrate species. An even more extensive database is available on the aquatic toxicity of individual aromatic constituents. The majority of published studies do not identify the type of gasoline evaluated, or even provide distinguishing characteristics such as aromatic content or presence of lead alkyls. As a result, comparison of results among studies using open and closed vessels, different ages and species of test animals and different gasoline types, is difficult.

The bulk of the available literature on gasoline relates to the environmental impact of monoaromatic (BTEX) and diaromatic (naphthalene, methylnaphthalenes) constituents. In general, non-oxygenated gasoline exhibits some short-term toxicity to freshwater and marine organisms, especially under closed vessel or flow-through exposure conditions in the laboratory. The components which are the most prominent in the water soluble fraction and cause aquatic toxicity, are also highly volatile and can be readily biodegraded by microorganisms.

ENVIRONMENTAL FATE
Ready Biodegradability: This material is expected to be readily biodegradable. Following spillage, the more volatile components of gasoline will be rapidly lost, with concurrent dissolution of these and other constituents into the water. Factors such as local environmental conditions (temperature, wind, mixing or wave action, soil type, etc), photo-oxidation, biodegradation and adsorption onto suspended sediments, can contribute to the weathering of spilled gasoline.

The aqueous solubility of non-oxygenated unleaded gasoline, based on analysis of benzene, toluene, ethylbenzene+xylenes and naphthalene, is reported to be 112 mg/l. Solubility data on individual gasoline constituents also available.

SECTION 13 DISPOSAL CONSIDERATIONS

Use material for its intended purpose or recycle if possible. This material, if it must be discarded, may meet the criteria of a hazardous waste as defined by USEPA under RCRA (40CFR261), Environment Canada, or other State, Provincial, and local regulations. Measurement of certain physical properties and analysis for regulated components may be necessary to make a correct determination. If this material is classified as a hazardous waste, federal law requires disposal at a licensed hazardous waste disposal

facility.

SECTION 14 TRANSPORT INFORMATION

The description shown may not apply to all shipping situations. Consult 49CFR, or appropriate Dangerous Goods Regulations, for additional description requirements (e.g., technical name) and mode-specific or quantity-specific shipping requirements.

TC Shipping Description: UN1203, GASOLINE, 3, II

IMO/IMDG Shipping Description: UN1203, GASOLINE, 3, II, FLASH POINT SEE SECTION 5

ICAO/IATA Shipping Description: UN1203, GASOLINE, 3, II

DOT Shipping Description: UN1203, GASOLINE, 3, II

SECTION 15 REGULATORY INFORMATION

REGULATORY LISTS SEARCHED:
01-1=IARC Group 1
01-2A=IARC Group 2A
01-2B=IARC Group 2B
35=WHMIS IDL

The following components of this material are found on the regulatory lists indicated.

Benzene	01-1, 35
Butane	35
Cyclohexane	35
Ethanol	01-1, 35
Ethyl benzene	01-2B, 35
Gasoline	01-2B
Heptane	35
Hexane	35
Methylcyclohexane	35
Naphthalene	01-2B, 35
Pentane, 2,2,4-trimethyl- (Isooctane)	35
Toluene (methylbenzene)	35
Xylene (contains o-, m-, & p- xylene isomers in varying amounts)	35

WHMIS CLASSIFICATION:
Class B, Division 2: Flammable Liquids
Class D, Division 2, Subdivision A: Very Toxic Material - Carcinogenicity
Class D, Division 2, Subdivision B: Toxic Material - Skin or Eye Irritation
This product has been classified in accordance with the hazard criteria of the Controlled Products Regulations and the MSDS contains all of the information required by those regulations. (See Hazardous Products Act (HPA), R.S.C. 1985, c.H-3,s.2).

MSDS PREPARATION:

This Material Safety Data Sheet has been prepared by the Toxicology and Health Risk Assessment Unit, ERTC, P.O. Box 1627, Richmond, CA 94804, (888)676-6183.

This product has been classified in accordance with the hazard criteria of the Controlled Products Regulations and the MSDS contains all of the information required by those regulations. (See Hazardous Products Act (HPA), R.S.C. 1985, c.H-3,s.2).

MSDS PREPARATION:

This Material Safety Data Sheet has been prepared by the Toxicology and Health Risk Assessment Unit, ERTC, P.O. Box 1627, Richmond, CA 94804, (888)676-6183.

Revision Date: MAY 10, 2011

SECTION 16 OTHER INFORMATION

HMIS RATINGS: Health: 2* Flammability: 3 Reactivity: 0

Emergency Overview

Physical State Liquid.

Color Transparent, clear to amber or red. **Odor** Pungent, characteristic gasoline.

DANGER:
Extremely flammable liquid; vapor may cause flash fire or explosion.
Vapor may travel considerable distance to source of ignition and flash back.
Use Only as a Motor Fuel. Do Not Siphon by Mouth.
Harmful or fatal if swallowed - Can enter lungs and cause damage.
High concentrations of vapor reduce oxygen available for breathing and may cause suffocation.
May be harmful if inhaled or absorbed through the skin.
Mist or vapor may irritate the eyes, mucous membranes, and respiratory tract.
Liquid contact may cause eye and skin irritation.
Overexposures may cause central nervous system (CNS) depression and target organ effects (See Section 3).
Harmful or fatal if swallowed - Can enter lung and cause damage.
Inhalation overexposure can increase the heart's susceptibility to arrhythmias (irregular beats).
Contains Benzene - Cancer Hazard.
Long term exposure to gasoline vapor has caused cancer in laboratory animals.
Avoid Spills. Spills may present both a physical and an environmental hazard.

SECTION 1. PRODUCT IDENTIFICATION

Trade Name	CITGO Gasolines, All Grades Unleaded	**Technical Contact**	(832) 486-5940
Product Number	Various	**Medical Emergency**	(832) 486-4700
CAS Number	Mixture.	**CHEMTREC Emergency (United States Only)**	(800) 424-9300
Product Family	Motor fuels.		

Synonyms Unleaded Gasolines; Conventional Unleaded Gasoline with Ethanol; Unleaded Gasoline with Ethanol; Reformulated Unleaded Gasoline with Ethanol; Motor Gasolines; Petrol; Automobile Motor Fuels; Finished Gasolines; Gasoline, Regular Unleaded; Gasoline, Mid-grade Unleaded; Gasoline, Premium Unleaded; Reformulated Gasolines (RFG); Reformulated Motor Fuels; Oxygenated Motor Spirits; Gasoline, Regular Reformulated; Gasoline, Mid-grade Reformulated; Gasoline, Premium Reformulated; CBOB; RBOB; GTAB; Clean Burning Gasoline (CBG); CARB Gasoline with Ethanol.

SECTION 2. COMPOSITION

Gasoline is a complex and variable mixture that originates from finished refinery streams. These streams can contain the components listed below that are regulated or are associated with certain potential health effects. The typical concentration of ethanol in gasoline does not exceed 10% (v/v).

Component Name(s)	CAS Registry No.	Concentration (%)
Toluene	108-88-3	<25
Pentanes, all isomers	Mixture	<20
Octanes, all isomers	Mixture	<20
Xylene, all isomers	1330-20-7	<18
Hexane, other isomers	Mixture	<15
Heptane, all isomers	142-82-5	<15
Ethanol	64-17-5	<10
n-Hexane	110-54-3	<8
Benzene	71-43-2	<5
Trimethylbenzenes, all isomers	25551-13-7	<5
2,2,4-Trimethylpentane	540-84-1	<5
Cumene	98-82-8	<4
Ethylbenzene	100-41-4	<4
1, 2, 4 Trimethylbenzene	95-63-6	<3
Cyclohexane	110-82-7	<3
Cyclopentane	287-92-3	<2
Naphthalene	91-20-3	<2
Styrene	100-42-5	<1

SECTION 3. HAZARDS IDENTIFICATION

Also see Emergency Overview and Hazard Ratings on the top of Page 1 of this MSDS.

Major Route(s) of Entry Skin contact. Eye contact. Inhalation. Ingestion.

Signs and Symptoms of Acute Exposure

Inhalation Breathing high concentrations may be harmful. Mist or vapor can irritate the throat and lungs. Breathing this material may cause central nervous system depression with symptoms including nausea, headache, dizziness, fatigue, drowsiness, or unconsciousness. Breathing high concentrations of this material, for example, in an enclosed space or by intentional abuse, can cause irregular heartbeats which can cause death.

Eye Contact This product can cause eye irritation with short-term contact with liquid, mists or vapor. Symptoms include stinging, watering, redness, and swelling. In severe cases, permanent eye damage can result.

Skin Contact This material can cause skin irritation. The severity of irritation will depend on the amount of material that is applied to the skin and the speed and thoroughness that it is removed. It is likely that some components of this material are able to pass into the body through the skin and may cause similar effects as from breathing or swallowing it. If the skin is damaged or abraded, absorption increases.

Ingestion

If swallowed, this material may irritate the mucous membranes of the mouth, throat, and esophagus. It can be readily absorbed by the stomach and intestinal tract. Symptoms include a burning sensation of the mouth and esophagus, nausea, vomiting, dizziness, staggered gait, drowsiness, loss of consciousness and delirium, as well as additional central nervous system (CNS) effects.

Due to its light viscosity, there is a danger of aspiration into the lungs during swallowing and subsequent vomiting. Aspiration can result in severe lung damage or death. Cardiovascular effects include shallow rapid pulse with pallor (loss of color in the face) followed by flushing (redness of the face). Also, progressive CNS depression, respiratory insufficiency and ventricular fibrillation leads to death.

Chronic Health Effects Summary

Intentional misuse by deliberately concentrating and inhaling gasoline can be harmful or fatal. Altered mental state, drowsiness, peripheral motor neuropathy, irreversible brain damage ("Petrol Sniffers Encephalopathy"), delirium, seizures and sudden death are associated with repeated abuse of gasoline or naphtha.

Chronic effects of ingestion and subsequent aspiration into the lungs may include pneumatocele (lung cavity) formation and chronic lung dysfunction.

Benzene, a component of this product, is associated with blood disorders and may damage bone marrow, causing certain types of anemia. The International Agency for Research on Cancer (IARC) (1987, 2004, 2007) and the U.S. EPA (IRIS 2007) have determined that benzene is a human carcinogen. It is also capable of causing changes in living cells' genetic material (chromosomes) and is considered to be a mutagen.

Repeated and prolonged overexposure to n-hexane has been associated with peripheral nerve tissue damage. Adverse effects include numbness, tingling, pain, and loss of muscle control in the extremities, disorientation, impaired vision and reflexes, decline in motor function and paralysis.

Prolonged or repeated overexposure to toluene, a component of this product, has been associated with reproductive effects in experimental animals and in long-term chemical abuse situations. Long-term overexposure to toluene has been associated with impaired color vision. Also, long-term overexposure to toluene in occupational environments have been associated with hearing damage.

Prolonged or repeated overexposure to xylene, a component of this product, has been associated with hearing damage in laboratory animals. Repeated overexposure may cause injury to bone marrow, blood cells, kidney, and liver.

Refer to Section 11 of this MSDS for additional health-related information.

Conditions Aggravated by Exposure

Disorders of the following organs or organ systems that may be aggravated by significant exposure to this material or its components include: Skin, Respiratory System, Liver, Kidneys, Central Nervous System (CNS), Cardiovascular System, Blood-forming system.

Target Organs

May cause damage to the following organs: blood, kidneys, lungs, the reproductive system, liver, mucous membranes, heart, peripheral nervous system, cardiovascular system, upper respiratory tract, skin, auditory system, bone marrow, central nervous system (CNS), eye, lens or cornea

Carcinogenic Potential

This material may contain benzene, ethylbenzene, naphthalene or styrene at concentrations above 0.1%. Benzene is considered to be a known human carcinogen by OSHA, IARC and NTP. IARC has identified ethylbenzene, styrene, naphthalene, gasoline and gasoline engine exhaust as possibly carcinogenic to humans (Group 2B) based on laboratory animal studies.

OSHA Hazard Classification is indicated by an "X" in the box adjacent to the hazard title. If no "X" is present, the product does not exhibit the hazard as defined in the OSHA Hazard Communication Standard (29 CFR 1910.1200).

OSHA Health Hazard Classification				OSHA Physical Hazard Classification					
Irritant	X	Sensitizer		Combustible		Explosive		Pyrophoric	
Toxic		Highly Toxic		Flammable	X	Oxidizer		Water-reactive	
Corrosive		Carcinogenic	X	Compressed Gas		Organic Peroxide		Unstable	

SECTION 4. FIRST AID MEASURES

Take proper precautions to ensure your own health and safety before attempting rescue or providing first aid. For more specific information, refer to Exposure Controls and Personal Protection in Section 8 of this MSDS.

Inhalation Immediately move victim to fresh air. If victim is not breathing, immediately begin rescue breathing. If heart has stopped, immediately begin cardiopulmonary resuscitation (CPR). If breathing is difficult, 100 percent humidified oxygen should be administered by a qualified individual. Seek medical attention immediately. If exposed to benzene in an emergency situation, a medical evaluation should be completed at the end of the work-shift in accordance with OSHA requirements.

Eye Contact Flush eyes with cool, clean, low-pressure water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of the eye and eyelid tissue. If easily accomplished, check for and remove contact lenses. If contact lenses cannot be removed, seek immediate medical attention. Do not use eye ointment. Seek medical attention.

Skin Contact Remove contaminated shoes and clothing. Flush affected area with large amounts of water. If skin surface is damaged, apply a clean dressing and seek medical attention. Do not use ointments. If skin surface is not damaged, clean affected area thoroughly with mild soap and water. Seek medical attention if tissue appears damaged or if pain or irritation persists.

Ingestion Do not induce vomiting. If spontaneous vomiting is about to occur, place victim's head below knees. If victim is drowsy or unconscious, place on the left side with head down. Never give anything by mouth to a person who is not fully conscious. Do not leave victim unattended. Seek medical attention immediately.

Notes to Physician INHALATION: Inhalation overexposure can produce toxic effects. Monitor for respiratory distress. If cough or difficulty in breathing develops, evaluate for upper respiratory tract inflammation, bronchitis, and pneumonitis. Administer supplemental oxygen with assisted ventilation, as required.

This material (or a component) sensitizes the heart to the effects of sympathomimetic amines. Epinephrine and other sympathomimetic drugs may initiate cardiac arrhythmias in individuals exposed to this material. Administration of sympathomimetic drugs should be avoided.

INGESTION: If ingested, this material presents a significant aspiration and chemical pneumonitis hazard. Induction of emesis is not recommended. Consider activated charcoal and/or gastric lavage. If patient is obtunded, protect the airway by cuffed endotracheal intubation or by placement of the body in a Trendelenburg and left lateral decubitus position.

SECTION 5. FIRE FIGHTING MEASURES

NFPA Flammability Classification NFPA Class-IB flammable liquid.

Flash Point Closed cup: -43°C (-45°F). (Tagliabue [ASTM D-56])

Lower Flammable Limit AP 1.4 % **Upper Flammable Limit** AP 7.6 %

Autoignition Temperature	AP 280°C (536°F)
Hazardous Combustion Products	Carbon dioxide, carbon monoxide, smoke, fumes, unburned hydrocarbons, aldehydes and other products of incomplete combustion.
Special Properties	Flammable Liquid! This material releases vapors at or below ambient temperatures. When mixed with air in certain proportions and exposed to an ignition source, its vapor can cause a flash fire. Use only with adequate ventilation. Vapors are heavier than air and may travel long distances along the ground to an ignition source and flash back. A vapor and air mixture can create an explosion hazard in confined spaces such as sewers. If container is not properly cooled, it can rupture in the heat of a fire.
Extinguishing Media	SMALL FIRE: Use dry chemicals, carbon dioxide, foam, or inert gas (nitrogen). Carbon dioxide and inert gas can displace oxygen. Use caution when applying carbon dioxide or inert gas in confined spaces. LARGE FIRE: Use foam, water fog, or water spray. Water may be ineffective. Water may not extinguish the fire. Water fog and spray are effective in cooling containers and adjacent structures. However, water can be used to cool the external walls of vessels to prevent excessive pressure, autoignition or explosion. DO NOT use a solid stream of water directly on the fire as the water may spread the fire to a larger area.
Protection of Fire Fighters	Firefighters must use full bunker gear including NIOSH-approved positive pressure self-contained breathing apparatus to protect against potential hazardous combustion or decomposition products and oxygen deficiencies. Evacuate area and fight the fire from a maximum distance or use unmanned hose holders or monitor nozzles. Cover pooling liquid with foam. Containers can build pressure if exposed to radiant heat; cool adjacent containers with flooding quantities of water until well after the fire is out. Withdraw immediately from the area if there is a rising sound from a venting safety device or discoloration of vessels, tanks, or pipelines. Be aware that burning liquid will float on water. Notify appropriate authorities of potential fire and explosion hazard if liquid enter sewers or waterways.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Take proper precautions to ensure your own health and safety before attempting spill control or clean-up. For more specific information, refer to the Emergency Overview on Page 1, Exposure Controls and Personal Protection in Section 8 and Disposal Considerations in Section 13 of this MSDS.

Flammable Liquid! Release causes an immediate fire or explosion hazard. Evacuate all non-essential personnel from immediate area and establish a "regulated zone" with site control and security. A vapor-suppressing foam may be used to reduce vapors. Eliminate all ignition sources. All equipment used when handling this material must be grounded. Stop the leak if it can done without risk. Do not touch or walk through spilled material. Remove spillage immediately from hard, smooth walking areas. Prevent spilled material from entering waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other non-combustible material and transfer to appropriate waste containers. Use clean, non-sparking tools to collect absorbed material.

For large spills, secure the area and control access. Prevent spilled material from entering sewers, storm drains, other drainage systems, and natural waterways. Dike far ahead of a liquid spill to ensure complete collection. Water mist or spray may be used to reduce or disperse vapors; but, it may not prevent ignition in closed spaces. This material will float on water and its run-off may create an explosion or fire hazard. Verify that responders are properly HAZWOPER-trained and wearing appropriate respiratory equipment and fire-resistant protective clothing during cleanup operations. In an urban area, cleanup spill as soon as possible; in natural environments, cleanup on advice from specialists. Pick up free liquid for recycle and/or disposal if it can be accomplished safely with explosion-proof equipment. Collect any excess material with absorbant pads, sand, or other inert non-combustible absorbent materials. Place into appropriate waste containers for later disposal. Comply with all applicable local, state and federal laws and regulations.

SECTION 7. HANDLING AND STORAGE

Handling

FLAMMABLE LIQUID AND VAPOR. **USE ONLY as a motor fuel.** DO NOT siphon by mouth. DO NOT use as a lighter fluid, solvent or cleaning fluid. Prior to handling or refueling, stop all engines and auxillary equipment. Turn off all electronic equipment including cellular telephones. DO NOT leave nozzle unattended during filling or refueling a vehicle. DO NOT re-enter vehicle while refueling. Keep nozzle spout in contact with the container during the entire filling operations.

A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading, following NFPA-704 and /or API RP 2003 requirements. Always keep nozzle in contact with the container throughout the loading process. Do not fill any portable container in or on a vehicle. Special precautions, such as reduced loading rates and increased monitoring, must be observed during "switch loading" operations (i.e., loading this material in tanks or shipping compartments that previously contained middle distillates or similar products).

A spill or leak can cause an immediate fire or explosion hazard. Keep containers closed and do not handle or store near heat, sparks, or any other potential ignition sources. Avoid contact with oxidizing agents. Do NOT breathe vapor. Use only with adequate ventilation and personal protection. Never siphon by mouth. Avoid contact with eyes, skin, and clothing. Prevent contact with food and tobacco products. Do NOT take internally.

When performing repairs and maintenance on contaminated equipment, keep unnecessary persons away from the area. Eliminate all potential ignition sources. Drain and purge equipment, as necessary, to remove material residues. Follow proper entry procedures, including compliance with 29 CFR 1910.146 prior to entering confined spaces such as tanks or pits. Use gloves constructed of impervious materials and protective clothing if direct contact is anticipated. Use appropriate respiratory protection when concentrations exceed any established occupational exposure level (See Section 8) Promptly remove contaminated clothing. Wash exposed skin thoroughly with soap and water after handling.

Non-equilibrium conditions may increase the fire hazard associated with this product. A static electrical charge can accumulate when this material is flowing through pipes, nozzles or filters and when it is agitated. A static spark discharge can ignite accumulated vapors particularly during dry weather conditions. Always bond receiving containers to the fill pipe before and during loading. Always confirm that receiving container is properly grounded. Bonding and grounding alone may be inadequate to eliminate fire and explosion hazards associated with electrostatic charges. Carefully review operations that may increase the risks associated with static electricity such as tank and container filling, tank cleaning, sampling, gauging, loading, filtering, mixing, agitation, etc. In addition to bonding and grounding, efforts to mitigate the hazards of an electrostatic discharge may include, but are not limited to, ventilation, inerting and/or reduction of transfer velocities. Dissipation of electrostatic charges may be improved with the use of conductivity additives when used with other mitigation efforts, including bonding and grounding. Always keep nozzle in contact with the container throughout the loading process.

Do NOT fill any portable container in or on a vehicle. Do NOT use compressed air for filling, discharging or other handling operations. Product container is NOT designed for elevated pressure. Do NOT pressurize, cut, weld, braze solder, drill, or grind on containers. Do NOT expose product containers to flames, sparks, heat or other potential ignition sources. Empty containers may contain material residues which can ignite with explosive force. Observe label precautions.

Protect the environment from releases of this material. Prevent discharges to surface waters and groundwater. Maintain handling, transfer and storage equipment in proper working order.

Misuse of empty containers can be dangerous. Empty containers may contain material residues which can ignite with explosive force. **Cutting or welding of empty containers**

can cause fire, explosion, or release of toxic fumes from residues. Do not pressurize or expose empty containers to open flame, sparks, or heat. Keep container closed and drum bungs in place. All label warnings and precautions must be observed. Return empty drums to a qualified reconditioner. Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling, or disposing of empty containers and/or waste residues of this material.

Storage

Keep container tightly closed. Store in a cool, dry, well-ventilated area. Store only in approved containers. Do not store with oxidizing agents. Do not store at elevated temperatures or in direct sunlight. Protect containers against physical damage. Head spaces in tanks and other containers may contain a mixture of air and vapor in the flammable range. Vapor may be ignited by static discharge. Storage area must meet OSHA requirements and applicable fire codes. Additional information regarding the design and control of hazards associated with the handling and storage of flammable and combustible liquids may be found in professional and industrial documents including, but not limited to, the National Fire Protection Association (NFPA) publications NFPA 30 ("Flammable and Combustible Liquid Code"), NFPA 77 ("Recommended Practice on Static Electricity") and the American Petroleum Institute (API) Recommended Practice 2003, (“Protection Against Ignitions Arising Out of Static, Lightning, and Stray Currents").

Consult appropriate federal, state and local authorities before reusing, reconditioning, reclaiming, recycling or disposing of empty containers or waste residues of this product.

SECTION 8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

Engineering Controls

Provide ventilation or other engineering controls to keep the airborne concentrations of vapor or mists below the applicable workplace exposure limits indicated below. All electrical equipment should comply with the National Electrical Code. An emergency eye wash station and safety shower should be located near the work-station.

Personal Protective Equipment

Personal protective equipment should be selected based upon the conditions under which this material is used. A hazard assessment of the work area for PPE requirements should be conducted by a qualified professional pursuant to OSHA regulations. The following pictograms represent the minimum requirements for personal protective equipment. For certain operations, additional PPE may be required.

Eye Protection

Safety glasses equipped with side shields are recommended as minimum protection in industrial settings. Chemical goggles should be worn during transfer operations or when there is a likelihood of misting, splashing, or spraying of this material. A suitable emergency eye wash water and safety shower should be located near the work station.

Hand Protection

Avoid skin contact. Use gloves (e.g., disposable PVC, neoprene, nitrile, vinyl, or PVC/NBR). Wash hands with plenty of mild soap and water before eating, drinking, smoking, use of toilet facilities or leaving work. DO NOT use this material as a skin cleaner.

Body Protection

Avoid skin contact. Wear long-sleeved fire-retardant garments (e.g., Nomex®) while working with flammable and combustible liquids. Additional chemical-resistant protective gear may be required if splashing or spraying conditions exist. This may include an apron, boots and additional facial protection. If product comes in contact with clothing, immediately remove soaked clothing and shower. Promptly remove and discard contaminated leather goods.

Respiratory Protection For known vapor concentrations above the occupational exposure guidelines (see below), use a NIOSH-approved organic vapor respirator if adequate protection is provided. Protection factors vary depending upon the type of respirator used. Respirators should be used in accordance with OSHA requirements (29 CFR 1910.134). For airborne vapor concentrations that exceed the recommended protection factors for organic vapor respirators, use a full-face, positive-pressure, supplied air respirator. Due to fire and explosion hazards, do not enter atmospheres containing concentrations greater than 10% of the lower flammable limit of this product.

General Comments Warning! Use of this material in spaces without adequate ventilation may result in generation of hazardous levels of combustion products and/or inadequate oxygen levels for breathing. Odor is an inadequate warning for hazardous conditions.

Occupational Exposure Guidelines

Substance	Applicable Workplace Exposure Levels
Gasoline	**ACGIH (United States).** TWA: 300 ppm 8 hour(s). STEL: 500 ppm 15 minute(s).
Pentanes, all isomers	**ACGIH (United States).** TWA: 600 ppm 8 hour(s). **OSHA (United States).** TWA: 1000 ppm 8 hour(s).
Octanes, all isomers	**ACGIH (United States).** TWA: 300 ppm 8 hour(s). **OSHA (United States).** TWA: 500 ppm 8 hour(s).
Toluene	**ACGIH (United States). Skin** TWA: 20 ppm 8 hour(s). **OSHA (United States).** TWA: 200 ppm 8 hour(s). CEIL: 300 ppm PEAK: 500 ppm 1 times per shift, 10 minute(s).
Hexane, other isomers	**ACGIH (United States).** TWA: 500 ppm 8 hour(s). STEL: 1000 ppm 15 minute(s).
Heptane, all isomers	**ACGIH (United States).** TWA: 400 ppm 8 hour(s). STEL: 500 ppm 15 minute(s). **OSHA (United States).** TWA: 500 ppm 8 hour(s).
Xylene, all isomers	**ACGIH (United States).** TWA: 100 ppm 8 hour(s). STEL: 150 ppm 15 minute(s). **OSHA (United States).** TWA: 100 ppm 8 hour(s).
Ethanol	**ACGIH (United States).** TWA: 1000 ppm 8 hour(s). **OSHA (United States).** TWA: 1000 ppm 8 hour(s).
Benzene	**ACGIH (United States). Skin** TWA: 0.5 ppm 8 hour(s). STEL: 2.5 ppm 15 minute(s). **OSHA (United States). Skin Notes: See Table Z-2 for exclusions in 20 CFR 1910.1028 to the PEL.** TWA: 1 ppm 8 hour(s). STEL: 5 ppm 15 minute(s).
n-Hexane	**ACGIH (United States). Skin** TWA: 50 ppm 8 hour(s). **OSHA (United States).** TWA: 500 ppm 8 hour(s).
Cumene	**ACGIH (United States).** TWA: 50 ppm 8 hour(s). **OSHA (United States). Skin**

	TWA: 50 ppm 8 hour(s).
Trimethylbenzenes, all isomers	**ACGIH (United States).** TWA: 25 ppm 8 hour(s).
Ethylbenzene	**ACGIH (United States).** TWA: 100 ppm 8 hour(s). STEL: 125 ppm 15 minute(s). **OSHA (United States).** TWA: 100 ppm 8 hour(s).
Cyclohexane	**ACGIH (United States).** TWA: 100 ppm 8 hour(s). **OSHA (United States).** TWA: 300 ppm 8 hour(s).
Cyclopentane	**ACGIH (United States).** TWA: 600 ppm 8 hour(s).
Naphthalene	**ACGIH (United States). Skin** TWA: 10 ppm 8 hour(s). STEL: 15 ppm 15 minute(s). **OSHA (United States).** TWA: 10 ppm 8 hour(s).
Styrene	**ACGIH (United States).** TWA: 20 ppm 8 hour(s). STEL: 40 ppm 15 minute(s). **OSHA (United States).** TWA: 100 ppm 8 hour(s). STEL: 200 ppm 15 minute(s). PEAK: 600 ppm

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES (TYPICAL)

Physical State	Liquid.	**Color**	Transparent, clear to amber or red.	**Odor**	Pungent, characteristic gasoline.
Specific Gravity	0.72 - 0.77 (Water = 1)	**pH**	Not applicable	**Vapor Density**	3 to 4 (Air = 1)

Boiling Range	38 to 204°C (100 to 400°F)	**Melting/Freezing Point**	Not available.
Vapor Pressure	220 to 450 mm Hg at 20°C (68°F) or 6 to 15 Reid-psia at 37.8°C (100°F).	**Volatility**	720 to 770 g/l VOC (w/v)
Solubility in Water	Very slightly soluble in cold water. (<0.1 % w/w)	**Viscosity (cSt @ 40°C)**	<1

Flash Point	Closed cup: -43°C (-45°F). (Tagliabue [ASTM D-56])
Additional Properties	Average Density at 60°F = 6.0 to 6.4 lbs./gal. (ASTM D-2161)

SECTION 10. STABILITY AND REACTIVITY

Chemical Stability Stable. **Hazardous Polymerization** Not expected to occur.

Conditions to Avoid	Keep away from heat, flame and other potential ignition sources. Keep away from strong oxidizing conditions and agents.
Materials Incompatibility	Strong acids, alkalies and oxidizers such as liquid chlorine, other halogens, hydrogen peroxide and oxygen.
Hazardous Decomposition Products	No additional hazardous decomposition products were identified other than the combustion products identified in Section 5 of this MSDS.

SECTION 11. TOXICOLOGICAL INFORMATION

For other health-related information, refer to the Emergency Overview on Page 1 and the Hazards Identification in Section 3 of this MSDS.

Toxicity Data

Gasoline:
VAPOR (TELo) Acute: 140 ppm (Human) (8 hours) - Mild eye irritant.
VAPOR (TELo) Acute: 500 ppm (Human) (1 hour) - Moderate eye irritant.
INHALATION (TCLo) Acute: 900 ppm (Human) (1 hour) - CNS and pulmonary effects.
DERMAL (TDLo) Acute: 53 mg/kg (Human) - Skin allergy effects.
INHALATION (LC50) Acute: 101,200 ppm (Rat, Mouse, & Guinea Pig) (5 minutes).

A major epidemiological study concluded that there was no increased risk of kidney cancer associated with gasoline exposures for petroleum refinery employees or neighboring residents. Another study identified a slight trend in kidney cancers among service station employees following a 30-year latency period. Two-year inhalation toxicity studies with fully vaporized unleaded gasoline (at concentrations of 67, 292 and 2,056 ppm in air) produced kidney damage and kidney tumors in male rats, but not in female rats or mice of either sex. Results from subsequent scientific studies suggest that the kidney damage, and probably the kidney tumor response, is limited to the male rat. The kidney tumors apparently were the result of the formation of alpha-2u-globulin, a protein unique to male rats. This finding is not considered relevant to human exposure. Under conditions of the study, there was no evidence that exposure to unleaded gasoline vapor is associated with developmental toxicity. Experimental studies with laboratory animals did suggest that overexposure to gasoline may adversely effect male reproductive performance. Also, in laboratory studies with rats, the maternal and developmental "no observable adverse effect level" (NOAEL) was determined to be 9,000 ppm (75% of the LEL value). Female mice developed a slightly higher incidence of liver tumors compared to controls at the highest concentration. In a four week inhalation study of Sprague Dawley® rats, gasoline vapor condensate was determined to induce sister chromatid exchanges in peripheral lymphocytes. IARC has listed gasoline as possibly carcinogenic to humans (Group 2B).

Pentanes, all isomers
Studies of pentane isomers in laboratory animals indicate exposure to extremely high levels (roughly 10 vol.%) may induce cardiac arrhythmias (irregular heartbeats) which may be serious or fatal.

Toluene:
Effects from Acute Exposure:
Deliberate inhalation of toluene at high concentrations (e.g., glue sniffing and solvent abuse) has been associated with adverse effects on the liver, kidney and nervous system and can cause CNS depression, cardiac arrhythmias and death. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects.

Effects from Repeated or Prolonged Exposure:
Studies of workers indicate long-term exposure may be related to impaired color vision and hearing. Some studies of workers suggest long-term exposure may be related to neurobehavioral and cognitive changes. Some of these effects have been observed in laboratory animals following repeated exposure to high levels of toluene. Several studies of workers suggest long-term exposure may be related to small increases in spontaneous abortions and changes in some gonadotropic hormones. However, the weight of evidence does not indicate toluene is a reproductive hazard to humans. Studies in laboratory animals indicate some changes in reproductive organs following high levels of exposure, but no significant effects on mating performance or reproduction were observed. Case studies of persons abusing toluene suggest isolated incidences of adverse effects on the fetus including birth defects. Findings in laboratory animals were largely negative. Positive findings include small increases in minor skeletal and visceral malformations and developmental delays following very high levels of maternal exposure. Studies of workers indicate long-term exposure may be related to effects on the liver, kidney and blood, but these appear to be limited to changes in serum enzymes and decreased leukocyte counts. Studies in laboratory

animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland following very high levels of exposure. The relevance of these findings to humans is not clear at this time.

Heptane, all isomers
n-Heptane was not mutagenic in the Salmonella/microsome (Ames) assay and is not considered to be carcinogenic.

Xylene, all isomers
Effects from Acute Exposure:
ORAL (LD_{50}), Acute: 4,300 mg/kg [Rat].
INHALATION (LC_{50}), Acute: 4,550 ppm for four hours [Rat].
DERMAL (LD_{50}), Acute: 14,100 uL/kg [Rabbit].
Overexposure to xylene may cause upper respiratory tract irritation, headache, cyanosis, blood serum changes, CNS damage and narcosis. Effects may be increased by the use of alcoholic beverages. Evidence of liver and kidney impairment were reported in workers recovering from a gross over-exposure.

Effects from Prolonged or Repeated Exposure:
Impaired neurological function was reported in workers exposed to solvents including xylene. Studies in laboratory animals have shown evidence of impaired hearing following high levels of exposure. Studies in laboratory animals suggest some changes in reproductive organs following high levels of exposure but no significant effects on reproduction were observed. Studies in laboratory animals indicate skeletal and visceral malformations, developmental delays, and increased fetal resorptions following extremely high levels of maternal exposure. Adverse effects on the liver, kidney, bone marrow (changes in blood cell parameters) were observed in laboratory animals following high levels of exposure. The relevance of these observations to humans is not clear at this time.

Ethanol:
Inhalation exposure to ethanol vapor at concentrations above applicable workplace exposure levels is expected to produce eye and mucus membrane irritation. Human exposure at concentrations from 1000 to 5000 ppm produced symptoms of narcosis, stupor and unconsciousness. Subjects exposed to ethanol vapor in concentrations between 500 and 10,000 ppm experienced coughing and smarting of the eyes and nose. At 15,000 ppm there was continuous lacrimation and coughing. While extensive acute and chronic effects can be expected with ethanol consumption, ingestion is not expected to be a significant route of exposure to this product.

Benzene:

ORAL (LD50):	Acute: 930 mg/kg [Rat]. 4700 mg/kg [Mouse].
INHALATION (LC50):	
(VAPOR):	Acute: 10000 ppm 7 hour(s) [Rat]. 9980 ppm 8 hour(s) [Mouse].

Studies of Workers Over-Exposed to Benzene:
Studies of workers exposed to benzene show clear evidence that over-exposure can cause cancer of the blood forming organs (acute myelogenous leukemia) and aplastic anemia, an often fatal disease. Studies also suggest over-exposure to benzene may be associated with other types of leukemia and other blood disorders. Some studies of workers exposed to benzene have shown an association with increased rates of chromosome aberrations in circulating lymphocytes. One study of women workers exposed to benzene suggested a weak association with irregular menstruation. However, other studies of workers exposed to benzene have not demonstrated clear evidence of an effect on fertility or reproductive outcome in humans. Benzene can cross the placenta and affect the developing fetus. Cases of aplastic anemia have been reported in the offspring of persons severely over-exposed to benzene.

Studies in Laboratory Animals:
Studies in laboratory animals indicate that prolonged, repeated exposure to high levels of benzene vapor can cause bone marrow suppression and cancer in multiple organ systems. Studies in laboratory animals show evidence of adverse effects on male reproductive organs following high levels of exposure but no significant effects on reproduction have been observed. Embryotoxicity has been reported in studies of laboratory animals but effects were

limited to reduced fetal weight and skeletal variations.

n-Hexane:
This material contains n-hexane. Long-term or repeated exposure to n-hexane can cause permanent peripheral nerve damage. Initial symptoms are numbness of the fingers and toes. Also, motor weakness can occur in the digits, but may also involve muscles of the arms, thighs and forearms. The onset of these symptoms may be delayed for several months to a year after the beginning of exposure. Co-exposure to methylethyl ketone or methyl isobutyl ketone increases the neurotoxic properties of n-hexane. In laboratory studies, prolonged exposure to elevated concentrations of n-hexane was associated with decreased sperm count and degenerative changes in the testicles of rats.

Cumene:
Effects from Acute Exposure:
Overexposure to cumene may cause upper respiratory tract irritation and severe CNS depression.

Effects from Prolonged or Repeated Exposure:
Studies in laboratory animals indicate evidence of adverse effects on the kidney and adrenal glands following high level exposure. The relevance of these findings to humans is not clear at this time.

Trimethylbenzenes, all isomers
Studies of Workers:
Levels of total hydrocarbon vapors present in the breathing atmosphere of these workers ranged from 10 to 60 ppm. The TCLo for humans is 10 ppm, with somnolence and respiratory tract irritation noted.

Studies in Laboratory Animals:
In inhalation studies with rats, four of ten animals died after exposures of 2400 ppm for 24 hours. An oral dose of 5 mL/kg resulted in death in one of ten rats. Minimum lethal intraperitoneal doses were 1.5 to 2.0 mL/kg in rats and 1.13 to 12 mL/kg in guinea pigs. Mesitylene (1, 3, 5 Trimethylbenzene) inhalation at concentrations of 1.5, 3.0, and 6.0 mg/L for six hours was associated with dose-related changes in white blood cell counts in rats. No significant effects on the complete blood count were noted with six hours per day exposure for five weeks, but elevations of alkaline phosphatase and SGOT were observed. Central nervous system depression and ataxia were noted in rats exposed to 5,100 to 9,180 ppm for two hours.

Ethylbenzene
Effects from Acute Exposure:
ORAL (LD50), Acute: 3,500 mg/kg [Rat].
DERMAL (LD50), Acute: 17,800 uL/kg [Rabbit].
INTRAPERITONEAL (LD50), Acute: 2,624 mg/kg [Rat].

Effects from Prolonged or Repeated Exposure:
Findings from a 2-year inhalation study in rodents conducted by NTP were as follows: Effects were observed only at the highest exposure level (750 ppm). At this level the incidence of renal tumors was elevated in male rats (tubular carcinomas) and female rats (tubular adenomas). Also, the incidence of tumors was elevated in male mice (alveolar and bronchiolar carcinomas) and female mice (hepatocellular carcinomas). IARC has classified ethyl benzene as “possibly carcinogenic to humans” (Group 2B). Studies in laboratory animals indicate some evidence of post-implantation deaths following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate limited evidence of renal malformations, resorptions, and developmental delays following high levels of maternal exposure. The relevance of these findings to humans is not clear at this time. Studies in laboratory animals indicate some evidence of adverse effects on the liver, kidney, thyroid, and pituitary gland.

Cyclohexane
ORAL (LD50): Acute: 12705 mg/kg [Rat]. 813 mg/kg [Mouse].

Cyclohexane can cause eye, skin and mucous membrane irritation, CNS depressant and

narcosis at elevated concentrations. In experimental animals exposed to lethal concentrations by inhalation or oral route, generalized vascular damage and degenerative changes in the heart, lungs, liver, kidneys and brain were identified.

Cyclohexane has been the focus of substantial testing in laboratory animals. Cyclohexane was not found to be genotoxic in several tests including unscheduled DNA synthesis, bacterial and mammalian cell mutation assays, and in vivo chromosomal aberration. An increase in chromosomal aberrations in bone marrow cells of rats exposed to cyclohexane was reported in the 1980's. However, a careful re-evaluation of slides from this study by the laboratory which conducted the study indicates these findings were in error, and that no significant chromosomal effects were observed in animals exposed to cyclohexane. Findings indicate long-term exposure to cyclohexane does not promote dermal tumorigenesis.

Naphthalene
Studies in Humans Overexposed to Naphthalene:
Severe jaundice, neurotoxicity (kernicterus) and fatalities have been reported in young children and infants as a result of hemolytic anemia from over-exposure to naphthalene. Persons with Glucose 6-phosphate dehydrogenase (G6PD) deficiency are more prone to the hemolytic effects of naphthalene. Adverse effects on the kidney have also been reported from over-exposure to naphthalene but these effects are believed to be a consequence of hemolytic anemia, and not a direct effect.

Studies in Laboratory Animals:
Hemolytic anemia has been observed in laboratory animals exposed to naphthalene. Laboratory rodents exposed to naphthalene vapor for 2 years (lifetime studies) developed non-neoplastic and neoplastic tumors and inflammatory lesions of the nasal and respiratory tract. Cataracts and other adverse effects on the eye have been observed in laboratory animals exposed to high levels of naphthalene. Findings from a large number of bacterial and mammalian cell mutation assays have been negative. A few studies have shown chromosomal effects (elevated levels of Sister Chromatid Exchange or chromosomal aberrations) *in vitro.*

Styrene
Neurological injury associated with chronic styrene exposure include distal hypesthesia, decreased nerve conduction velocity, and altered psychomotor performance. These effects did not occur with exposures to airborne concentrations that were less than 100 ppm. Increased deaths from degenerative neurological disorders were found in a comprehensive epidemiological study of Danish reinforced plastics workers. These workers were reported to have a 2.5-fold increased risk for myeloid leukemia with clonal chromosome aberrations. Also, there are several studies that suggest potential reproductive effects in humans and experimental animals from overexposure to styrene. Styrene was not mutagenic in the standard (liquid phase) Ames Salmonella/microsome assay, but was weakly positive when tested in the vapor phase. IARC has listed styrene as possibly carcinogenic to humans (Group 2B).

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

Unleaded gasoline is potentially toxic to freshwater and saltwater ecosystems. Various grades of gasoline exhibited range of lethal toxicity (LC_{100}) from 40 PPM to 100 PPM in ambient stream water with Rainbow Trout (*Salmo irideus*). A 24-hour TLm (Median Toxic Limit) was calculated to be 90 PPM with juvenile American Shad (*Squalius cephalus*). In Bluegill Sunfish (*Lepomis macrochirus*), Grey Mullet (*Chelon labrosus*) and Gulf Menhaden (*Brevoortia patronus*), gasoline exhibited a 96-hour LC_{50} of 8 PPM, 2 PPM, and 2 PPM, respectively.

Environmental Fate

Biodegradability: Readily biodegradable in aerobic conditions. Residual components most recalcitrant to biodegration are branched alkanes.

Partition Coefficient (log Kow): 2.13 to 4.85.

Photodegration: Gasoline will partition to air, with the atmospheric half-life for constituents ranging from 0.8 days to 16 days.

Stability in water: Gasoline is not readily susceptible to hydrolysis under aquatic conditions, and the constituents readily partition to air.

SECTION 13. DISPOSAL CONSIDERATIONS

Hazard characteristic and regulatory waste stream classification can change with product use. Accordingly, it is the responsibility of the user to determine the proper storage, transportation, treatment and/or disposal methodologies for spent materials and residues at the time of disposition.

Maximize material recovery for reuse or recycling. Recovered non-usable material may be regulated by US EPA as a hazardous waste due to its ignitibility (D001) and/or its toxic (D018) characteristics. Conditions of use may cause this material to become a "hazardous waste", as defined by federal or state regulations. It is the responsibility of the user to determine if the material is a RCRA "hazardous waste" at the time of disposal. Transportation, treatment, storage and disposal of waste material must be conducted in accordance with RCRA regulations (see 40 CFR 260 through 40 CFR 271). State and/or local regulations may be more restrictive. Contact your regional US EPA office for guidance concerning case specfic disposal issues.

SECTION 14. TRANSPORT INFORMATION

The shipping description below may not represent requirements for all modes of transportation, shipping methods or locations outside of the United States.

US DOT Status A U.S. Department of Transportation regulated material.

Proper Shipping Name Gasoline, 3, UN 1203, PG II
Gasohol, 3, NA 1203, PGII (Use only for gasoline blended with less than 20% ethanol)

Hazard Class 3 DOT Class: Flammable liquid.

Packing Group II

UN/NA Number UN1203 or NA1203

Reportable Quantity A Reportable Quantity (RQ) has not been established for this material.

Placard(s)

Emergency Response Guide No. 128

MARPOL III Status Not a DOT "Marine Pollutant" per 49 CFR 171.8.

SECTION 15. REGULATORY INFORMATION

TSCA Inventory This product and/or its components are listed on the Toxic Substances Control Act (TSCA) inventory.

SARA 302/304 Emergency Planning and Notification The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to Subparts 302 and 304 to submit emergency planning and notification information based on Threshold Planning Quantities (TPQs) and Reportable Quantities (RQs) for "Extremely Hazardous Substances" listed in 40 CFR 302.4 and 40 CFR 355. No components were identified.

SARA 311/312 Hazard Identification The Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires facilities subject to this subpart to submit aggregate information on chemicals by "Hazard Category" as defined in 40 CFR 370.2. This material would be classified under the following hazard categories:

Fire, Acute (Immediate) Health Hazard, Chronic (Delayed) Health Hazard

SARA 313 Toxic Chemical Notification and Release Reporting

This product contains the following components in concentrations above *de minimis* levels that are listed as toxic chemicals in 40 CFR Part 372 pursuant to the requirements of Section 313 of SARA:
Toluene [CAS No.: 108-88-3] Concentration: <25%
Xylene, all isomers [CAS No.: 1330-20-7] Concentration: <18%
n-Hexane [CAS No.: 110-54-3] Concentration: <8%
Benzene [CAS No.: 71-43-2] Concentration: <5%
Cumene [CAS No.: 98-82-8] Concentration: <4%
Ethylbenzene [CAS No.: 100-41-4] Concentration: <4%
1,2,4--Trimethylbenzene [CAS No.: 95-63-6] Concentration: <3%
Cyclohexane [CAS No.: 110-82-7] Concentration: <3%
Naphthalene [CAS No.: 91-20-3] Concentration: <2%
Styrene [CAS No.: 100-42-5] Concentration: <1%

CERCLA

The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) requires notification of the National Response Center concerning release of quantities of "hazardous substances" equal to or greater than the reportable quantities (RQ's) listed in 40 CFR 302.4. As defined by CERCLA, the term "hazardous substance" does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically designated in 40 CFR 302.4. Chemical substances present in this product or refinery stream that may be subject to this statute are:
Toluene [CAS No.: 108-88-3] RQ = 1000 lbs. (453.6 kg) Concentration: <25%
Xylene, all isomers [CAS No.: 1330-20-7] RQ = 100 lbs. (45.36 kg) Concentration: <18%
n-Hexane [CAS No.: 110-54-3] RQ = 5000 lbs. (2268 kg) Concentration: <8%
Benzene [CAS No.: 71-43-2] RQ = 10 lbs. (4.536 kg) Concentration: <5%
2,2,4-Trimethylpentane [CAS No.: 540-84-1] RQ = 1000 lbs. (453.6 kg) Concentration: <5%
Cumene [CAS No.: 98-82-8] RQ = 5000 lbs. (2268 kg) Concentration: <4%
Ethylbenzene [CAS No.: 100-41-4] RQ = 1000 lbs. (453.6 kg) Concentration: <4%
Cyclohexane [CAS No.: 110-82-7] RQ = 1000 lbs. (453.6 kg) Concentration: <3%
Naphthalene [CAS No.: 91-20-3] RQ = 100 lbs. (45.36 kg) Concentration: <2%
Styrene [CAS No.: 100-42-5] RQ = 1000 lbs. (453.6 kg) Concentration: <1%

Clean Water Act (CWA)

This material is classified as an oil under Section 311 of the Clean Water Act (CWA) and the Oil Pollution Act of 1990 (OPA). Discharges or spills which produce a visible sheen on waters of the United States, their adjoining shorelines, or into conduits leading to surface waters must be reported to the EPA's National Response Center at (800) 424-8802.

California Proposition 65

This material may contain the following components which are known to the State of California to cause cancer, birth defects or other reproductive harm, and may be subject to the requirements of California Proposition 65 (CA Health & Safety Code Section 25249.5):
Gasoline (Wholly Vaporized and Engine Exhaust), Benzene [CAS No. 71-43-3], Toluene [CAS No. 108-88-3], Ethylbenzene [CAS No.100-41-4] and Naphthalene [CAS No.91-20-3]

New Jersey Right-to-Know Label

Gasoline [NJDEP CAS No. 8006-61-9]

Additional Remarks

As minimum requirements, CITGO recommends that the following advisory information be displayed on equipment used to dispense gasoline in motor vehicles. Additional warnings specified by various regulatory authorities may be required: "DANGER: Extremely Flammable. Use as a Motor Fuel Only. No Smoking. Stop Engine. Turn Off All Electronic Equipment including Cellular Telephones. Do Not Overfill Tank. Keep Away from Heat and Flames. Do Not leave nozzle unattended during refueling. **Static Sparks Can Cause a Fire, especially when filling portable containers.** Containers must be metal or other material approved for storing gasoline. PLACE CONTAINER ON GROUND. DO NOT FILL ANY PORTABLE CONTAINER IN OR ON A VEHICLE. Keep nozzle spout in contact with the container during the entire filling operation. **Harmful or Fatal if Swallowed. Long Term-Exposure Has Caused Cancer in Laboratory Animals.** Avoid prolonged breathing of vapors. Keep face away from nozzle and gas tank. Never siphon by mouth."
WHMIS Class B-2: Flammable liquid with a flash point lower than 37.8°C (100°F).
WHMIS Class D-2B: Material causing other toxic effects (TOXIC).

SECTION 16. OTHER INFORMATION

Refer to the top of Page 1 for the HMIS and NFPA Hazard Ratings for this product.

MATERIAL SAFETY DATA SHEET

1. Product and Company Identification

Material name	**UNLEADED GASOLINE**
Version #	03
Issue date	07-28-2011
Revision date	11-13-2012
Supersedes date	09-28-2012
MSDS Number	002
Product use	Motor fuels.
Synonym(s)	Regular/Premium/Midgrade - Unleaded Gasoline, RFG - Reformulated Unleaded Gasoline, Conventional Unleaded Gasoline, Oxygenated Unleaded Gasoline, Non-Oxygenated Unleaded Gasoline, CARB (California Air Resource Board) Unleaded Gasoline, RBOB - Reformulated Blendstock for Oxygenate Blending, CBOB - Conventional Blendstock for Oxygenate Blending, Petrol, Motor Fuel. See section 16 for complete information.
Manufacturer/Supplier	Valero Marketing & Supply Company and Affiliates P.O. Box 696000 San Antonio, TX 78269-6000
General Assistance	210-345-4593
Emergency	24 Hour Emergency 866-565-5220 1-800-424-9300 (CHEMTREC USA)

2. Hazards Identification

Physical state	Liquid.
Appearance	Light straw to red clear liquid with characteristic strong odor of gasoline.
Emergency overview	DANGER! Extremely flammable liquid and vapor - vapor may cause flash fire. Will be easily ignited by heat, spark or flames. Heat may cause the containers to explode. Harmful if inhaled, absorbed through skin, or swallowed. Aspiration may cause lung damage. Irritating to eyes, respiratory system and skin. In high concentrations, vapors and spray mists are narcotic and may cause headache, fatigue, dizziness and nausea. Contains benzene. Cancer hazard - can cause cancer. Mutagen. May cause heritable genetic damage. May cause adverse reproductive effects - such as birth defects, miscarriages, or infertility. Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment. Static accumulating flammable materials can become electrostatically charged even in bonded and grounded equipment. Sparks may ignite material and vapor may cause flash fire (or explosion).
OSHA regulatory status	This product is considered hazardous under 29 CFR 1910.1200 (Hazard Communication).
Potential health effects	
Routes of exposure	Inhalation. Ingestion. Skin contact. Eye contact.
Eyes	Contact may irritate or burn eyes. Eye contact may result in corneal injury.
Skin	Harmful if absorbed through skin. Irritating to skin. Frequent or prolonged contact may defat and dry the skin, leading to discomfort and dermatitis.
Inhalation	Harmful if inhaled. Irritating to respiratory system. In high concentrations, vapors and spray mists are narcotic and may cause headache, fatigue, dizziness and nausea. May cause breathing disorders and lung damage. May cause cancer by inhalation. Prolonged inhalation may be harmful.
Ingestion	Harmful if swallowed. Ingestion may result in vomiting; aspiration (breathing) of vomitus into lungs must be avoided as even small quantities may result in aspiration pneumonitis. Irritating to mouth, throat, and stomach.
Target organs	Blood. Eyes. Liver. Respiratory system. Skin. Kidneys. Central nervous system.

Chronic effects Cancer hazard. Contains material which may have reproductive toxicity, teratogenetic or mutagenic effects. Liver injury may occur. Kidney injury may occur. May cause central nervous system disorder (e.g., narcosis involving a loss of coordination, weakness, fatigue, mental confusion and blurred vision) and/or damage. Frequent or prolonged contact may defat and dry the skin, leading to discomfort and dermatitis.

Signs and symptoms Irritation of nose and throat. Irritation of eyes and mucous membranes. Skin irritation. Unconsciousness. Corneal damage. Narcosis. Cyanosis (blue tissue condition, nails, lips, and/or skin). Decrease in motor functions. Behavioral changes. Edema. Liver enlargement. Jaundice. Conjunctivitis. Proteinuria. Defatting of the skin. Rash.

Potential environmental effects Toxic to aquatic organisms. Harmful to aquatic life with long lasting effects.

3. Composition / Information on Ingredients

Components	CAS #	Percent
Gasoline	86290-81-5	0-100
Toluene	108-88-3	0-30
Hexane (Other Isomers)	96-14-0	5-25
Xylene (o, m, p isomers)	1330-20-7	0-25
Octane (All isomers)	111-65-9	0-18.5
Ethanol	64-17-5	0-10
1,2,4, Trimethylbenzene	95-63-6	0-6
n-Heptane	142-82-5	1-5
Pentane	109-66-0	1-5
Cumene	98-82-8	0-5
Ethylbenzene	100-41-4	0-5
Benzene	71-43-2	0-4.9
n-Hexane	110-54-3	0-3
Cyclohexane	110-82-7	0-3

4. First Aid Measures

First aid procedures

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Get medical attention.

Skin contact Remove contaminated clothing and shoes. Wash off immediately with soap and plenty of water. Get medical attention if irritation develops or persists. Wash clothing separately before reuse. Destroy or thoroughly clean contaminated shoes. If high pressure injection under the skin occurs, always seek medical attention.

Inhalation Move to fresh air. If breathing is difficult, give oxygen. If not breathing, give artificial respiration. Get medical attention.

Ingestion Rinse mouth thoroughly. Do not induce vomiting without advice from poison control center. Do not give mouth-to-mouth resuscitation. If vomiting occurs, keep head low so that stomach content does not get into the lungs. Get medical attention immediately.

Notes to physician In case of shortness of breath, give oxygen. Keep victim warm. Keep victim under observation. Symptoms may be delayed.

General advice If exposed or concerned: get medical attention/advice. Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves. Show this safety data sheet to the doctor in attendance. Wash contaminated clothing before re-use.

5. Fire Fighting Measures

Flammable properties Flammable by OSHA criteria. Containers may explode when heated.

Extinguishing media

Suitable extinguishing media Water spray. Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media Do not use a solid water stream as it may scatter and spread fire.

Protection of firefighters

Specific hazards arising from the chemical	Vapor may cause flash fire. Vapors can flow along surfaces to distant ignition source and flash back. Sensitive to static discharge.
Protective equipment and precautions for firefighters	Wear full protective clothing, including helmet, self-contained positive pressure or pressure demand breathing apparatus, protective clothing and face mask.
Fire fighting equipment/instructions	Wear full protective clothing, including helmet, self-contained positive pressure or pressure demand breathing apparatus, protective clothing and face mask. Withdraw immediately in case of rising sound from venting safety devices or any discoloration of tanks due to fire. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Move containers from fire area if you can do it without risk. In the event of fire, cool tanks with water spray. Cool containers exposed to flames with water until well after the fire is out. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Vapors may form explosive air mixtures even at room temperature. Prevent buildup of vapors or gases to explosive concentrations. Some of these materials, if spilled, may evaporate leaving a flammable residue. Water runoff can cause environmental damage. Use compatible foam to minimize vapor generation as needed.
Specific methods	In the event of fire and/or explosion do not breathe fumes. Use water spray to cool unopened containers.
Hazardous combustion products	Carbon monoxide. Carbon Dioxide. Sulfur oxides. Nitrogen oxides (NOx). Hydrocarbons.

6. Accidental Release Measures

Personal precautions	Keep unnecessary personnel away. Local authorities should be advised if significant spills cannot be contained. Keep upwind. Keep out of low areas. Ventilate closed spaces before entering. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. See Section 8 of the MSDS for Personal Protective Equipment.
Environmental precautions	Gasoline may contain oxygenated blend products (Ethanol, etc.) that are soluble in water and therefore precautions should be taken to protect surface and groundwater sources from contamination. If facility or operation has an "oil or hazardous substance contingency plan", activate its procedures. Stay upwind and away from spill. Wear appropriate protective equipment including respiratory protection as conditions warrant. Do not enter or stay in area unless monitoring indicates that it is safe to do so. Isolate hazard area and restrict entry to emergency crew. Extremely flammable. Review Firefighting Measures, Section 5, before proceeding with clean up. Keep all sources of ignition (flames, smoking, flares, etc.) and hot surfaces away from release. Contain spill in smallest possible area. Recover as much product as possible (e.g. by vacuuming). Stop leak if it can be done without risk. Use water spray to disperse vapors. Use compatible foam to minimize vapor generation as needed. Spilled material may be absorbed by an appropriate absorbent, and then handled in accordance with environmental regulations. Prevent spilled material from entering sewers, storm drains, other unauthorized treatment or drainage systems and natural waterways. Contact fire authorities and appropriate federal, state and local agencies. If spill of any amount is made into or upon navigable waters, the contiguous zone, or adjoining shorelines, contact the National Response Center at 1-800-424-8802. For highway or railways spills, contact Chemtrec at 1-800-424-9300.
Methods for containment	Eliminate all ignition sources (no smoking, flares, sparks, or flames in immediate area). Stop leak if you can do so without risk. This material is a water pollutant and should be prevented from contaminating soil or from entering sewage and drainage systems and bodies of water. Dike the spilled material, where this is possible. Prevent entry into waterways, sewers, basements or confined areas.
Methods for cleaning up	Use non-sparking tools and explosion-proof equipment. Small Spills: Absorb spill with vermiculite or other inert material, then place in a container for chemical waste. Clean surface thoroughly to remove residual contamination. This material and its container must be disposed of as hazardous waste. Large Spills: Use a non-combustible material like vermiculite, sand or earth to soak up the product and place into a container for later disposal. Prevent product from entering drains. Do not allow material to contaminate ground water system. Should not be released into the environment.
Other information	Clean up in accordance with all applicable regulations.

7. Handling and Storage

Handling

Eliminate sources of ignition. Avoid spark promoters. Ground/bond container and equipment. These alone may be insufficient to remove static electricity.
Wear personal protective equipment. Do not breathe dust/fume/gas/mist/vapors/spray. Avoid contact with eyes, skin, and clothing. Do not taste or swallow. Avoid prolonged exposure. Use only with adequate ventilation. Wash thoroughly after handling. The product is extremely flammable, and explosive vapor/air mixtures may be formed even at normal room temperatures. DO NOT handle, store or open near an open flame, sources of heat or sources of ignition. Protect material from direct sunlight. Take precautionary measures against static discharges. All equipment used when handling the product must be grounded. Use non-sparking tools and explosion-proof equipment. When using, do not eat, drink or smoke. Avoid release to the environment.

Storage

Flammable liquid storage. Do not handle or store near an open flame, heat or other sources of ignition. This material can accumulate static charge which may cause spark and become an ignition source. The pressure in sealed containers can increase under the influence of heat. Keep container tightly closed in a cool, well-ventilated place. Keep away from food, drink and animal feedingstuffs. Keep out of the reach of children.

8. Exposure Controls / Personal Protection

Occupational exposure limits

US. ACGIH Threshold Limit Values

Components	Type	Value
1,2,4, Trimethylbenzene (CAS 95-63-6)	TWA	25 ppm
Benzene (CAS 71-43-2)	STEL	2.5 ppm
	TWA	0.5 ppm
Cumene (CAS 98-82-8)	TWA	50 ppm
Cyclohexane (CAS 110-82-7)	TWA	100 ppm
Ethanol (CAS 64-17-5)	STEL	1000 ppm
Ethylbenzene (CAS 100-41-4)	TWA	20 ppm
Gasoline (CAS 86290-81-5)	STEL	500 ppm
	TWA	300 ppm
Hexane (Other Isomers) (CAS 96-14-0)	STEL	1000 ppm
	TWA	500 ppm
n-Heptane (CAS 142-82-5)	STEL	500 ppm
	TWA	400 ppm
n-Hexane (CAS 110-54-3)	TWA	50 ppm
Octane (All isomers) (CAS 111-65-9)	TWA	300 ppm
Pentane (CAS 109-66-0)	TWA	600 ppm
Toluene (CAS 108-88-3)	TWA	20 ppm
Xylene (o, m, p isomers) (CAS 1330-20-7)	STEL	150 ppm

Engineering controls	Provide adequate general and local exhaust ventilation. Use process enclosures, local exhaust ventilation, or other engineering controls to control airborne levels below recommended exposure limits. Use explosion-proof equipment.
Personal protective equipment	
Eye / face protection	Wear safety glasses. If splash potential exists, wear full face shield or chemical goggles.
Skin protection	Wear chemical-resistant, impervious gloves. Full body suit and boots are recommended when handling large volumes or in emergency situations. Flame retardant protective clothing is recommended.
Respiratory protection	Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator. If workplace exposure limits for product or components are exceeded, NIOSH approved equipment should be worn. Proper respirator selection should be determined by adequately trained personnel, based on the contaminants, the degree of potential exposure and published respiratory protection factors. This equipment should be available for nonroutine and emergency use.
General hygiene considerations	Consult supervisor for special handling instructions. Avoid contact with eyes. Avoid contact with skin. Keep away from food and drink. Wash hands before breaks and immediately after handling the product. Provide eyewash station and safety shower. Handle in accordance with good industrial hygiene and safety practice.

9. Physical & Chemical Properties

Appearance	Light straw to red clear liquid with characteristic strong odor of gasoline.
Physical state	Liquid.
Form	Liquid.
Color	Light straw to red clear.
Odor	Characteristic Gasoline Odor (Strong).
Odor threshold	Not available.
pH	Not available.
Vapor pressure	60.8 - 101.3 kPa (20°C)
Vapor density	3 - 4 (Air=1)
Boiling point	80.1 - 440.1 °F (26.7 - 226.7 °C)
Melting point/Freezing point	44 °F (6.67 °C) May start to solidify at this temperature. This is based on data for the following ingredient: Cyclohexane. Weighted average: -91.9 deg C (-133.4 deg F)
Solubility (water)	Very slightly soluble.
Specific gravity	0.66 - 0.75 (Water=1) (60°F)
Flash point	-40 °F (-40 °C) (closed cup)
Flammability limits in air, upper, % by volume	7.1 %
Flammability limits in air, lower, % by volume	1.3 %
Auto-ignition temperature	> 500 °F (> 260 °C)
VOC	100 %
Evaporation rate	10 - 11 BuAc
Other data	
Flash point class	Flammable IA

10. Chemical Stability & Reactivity Information

Chemical stability	Stable under normal temperature conditions and recommended use.
Conditions to avoid	Heat, flames and sparks. Ignition sources. Contact with incompatible materials. Do not pressurize, cut, weld, braze, solder, drill, grind or expose empty containers to heat, flame, sparks, static electricity, or other sources of ignition; they may explode and cause injury or death.
Incompatible materials	Strong oxidizing agents.
Hazardous decomposition products	Carbon oxides. Sulfur oxides. Nitrogen oxides (NOx). Hydrocarbons.
Possibility of hazardous reactions	Hazardous polymerization does not occur.

11. Toxicological Information

Toxicological data

Components	Species	Test Results
1,2,4, Trimethylbenzene (CAS 95-63-6)		
Acute		
Dermal		
LD50	Rabbit	> 3160 mg/kg
Inhalation		
LC50	Rat	> 2000 mg/l, 48 Hours
Oral		
LD50	Rat	6 g/kg
Benzene (CAS 71-43-2)		
Acute		
Oral		
LD50	Rat	3306 mg/kg
Cumene (CAS 98-82-8)		
Acute		
Inhalation		
LC50	Mouse	2000 mg/l, 7 Hours
	Rat	8000 mg/l, 4 Hours
Oral		
LD50	Rat	1400 mg/kg
		2.91 g/kg
Cyclohexane (CAS 110-82-7)		
Acute		
Oral		
LD50	Rat	12705 mg/kg
Ethanol (CAS 64-17-5)		
Acute		
Inhalation		
LC50	Rat	30000 mg/m3
Oral		
LD50	Rat	11.5 g/kg
Ethylbenzene (CAS 100-41-4)		
Acute		
Dermal		
LD50	Rabbit	> 5000 mg/kg
Oral		
LD50	Rat	5.46 g/kg
n-Heptane (CAS 142-82-5)		
Acute		
Inhalation		
LC50	Rat	103 mg/l, 4 Hours
Octane (All isomers) (CAS 111-65-9)		
Acute		
Inhalation		
LC50	Rat	118 mg/l, 4 Hours
Pentane (CAS 109-66-0)		
Acute		
Inhalation		
LC50	Rat	364 mg/l, 4 Hours

Components	Species	Test Results
Toluene (CAS 108-88-3)		
Acute		
Dermal		
LD50	Rabbit	14.1 ml/kg
Inhalation		
LC50	Rat	49000 mg/m³, 4 Hours
Oral		
LD50	Rat	636 mg/kg
Xylene (o, m, p isomers) (CAS 1330-20-7)		
Acute		
Oral		
LD50	Rat	4300 mg/kg

Sensitization This substance may have a potential for sensitization which may provoke an allergic reaction among sensitive individuals.

Acute effects Harmful if inhaled, absorbed through skin, or swallowed. Harmful: may cause lung damage if swallowed. Irritating to eyes, respiratory system and skin. In high concentrations, vapors and spray mists are narcotic and may cause headache, fatigue, dizziness and nausea.

Local effects

US. ACGIH Threshold Limit Values

Benzene (CAS 71-43-2)	Can be absorbed through the skin.
n-Hexane (CAS 110-54-3)	Can be absorbed through the skin.

Chronic effects Repeated exposure of laboratory animals to high concentrations of gasoline vapors has caused kidney damage and cancer in rats and cancer in mice. Gasoline was evaluated for genetic activity in assays using microbial cells, cultured mammalian cells and rat bone marrow cells. The results were all negative so gasoline was considered nonmutagenic under these conditions. Overexposure to this product or its components has been suggested as a cause of liver abnormalities in laboratory animals and humans. Lifetime studies by the American Petroleum Institute have shown that kidney damage and kidney cancer can occur in male rats after prolonged inhalation exposures at elevated concentrations of total gasoline. Kidneys of mice and female rats were unaffected. The U.S. EPA Risk Assessment Forum has concluded that the male rat kidney tumor results are not relevant for humans. Total gasoline exposure also produced liver tumors in female mice only. The implication of these data for humans has not been determined.

Subchronic effects Subchronic inhalation of benzene by rats produced decreased white blood cell counts, decreased bone marrow cell activity, increased red blood cell activity and cataracts. Blood disorders may occur after prolonged inhalation, prolonged skin contact and/or ingestion. Liver and kidney damage may occur after prolonged and repeated exposure.

Carcinogenicity

ACGIH Carcinogens

Benzene (CAS 71-43-2)	A1 Confirmed human carcinogen.
Ethanol (CAS 64-17-5)	A3 Confirmed animal carcinogen with unknown relevance to humans.
Ethylbenzene (CAS 100-41-4)	A3 Confirmed animal carcinogen with unknown relevance to humans.
Gasoline (CAS 86290-81-5)	A3 Confirmed animal carcinogen with unknown relevance to humans.
Toluene (CAS 108-88-3)	A4 Not classifiable as a human carcinogen.
Xylene (o, m, p isomers) (CAS 1330-20-7)	A4 Not classifiable as a human carcinogen.

IARC Monographs. Overall Evaluation of Carcinogenicity

Benzene (CAS 71-43-2)	1 Carcinogenic to humans.
Cumene (CAS 98-82-8)	2B Possibly carcinogenic to humans.
Ethylbenzene (CAS 100-41-4)	2B Possibly carcinogenic to humans.
Gasoline (CAS 86290-81-5)	2B Possibly carcinogenic to humans.
Toluene (CAS 108-88-3)	3 Not classifiable as to carcinogenicity to humans.
Xylene (o, m, p isomers) (CAS 1330-20-7)	3 Not classifiable as to carcinogenicity to humans.

US NTP Report on Carcinogens: Known carcinogen

Benzene (CAS 71-43-2)	Known To Be Human Carcinogen.

US. OSHA Specifically Regulated Substances (29 CFR 1910.1001-1050)

Benzene (CAS 71-43-2) Cancer hazard.

Epidemiology Contains benzene. Human epidemiology studies indicate that prolonged and/or repeated overexposure to benzene may cause damage to the blood-producing system and serious blood disorders, including leukemia. Animal tests suggest that prolonged and/or repeated overexposure to benzene may damage the embryo/fetus. The relevance of these animal studies to humans has not been fully established. Studies have shown a risk of spontaneous abortions in women exposed to high concentrations of organic solvents during pregnancy.

Mutagenicity In in-vitro experiments, neither benzene, toluene nor xylene changed the number of sister-chromatid exchanges (SCEs) or the number of chromosomal aberrations in human lymphocytes. However, toluene and xylene caused a significant cell growth inhibition which was not observed with benzene in the same concentrations. In in-vivo experiments, toluene changed the number of sister-chromatid exchanges (SCEs) in human lymphocytes. Toluene may cause heritable genetic damage.

Neurological effects Chronic exposure to high concentrations of various hydrocarbon blends may lead to polyneuropathy (peripheral nerve damage), characterized by progressive weakness and numbness in the extremities, loss of deep tendon reflexes and reduction of motor nerve conduction velocity. Numerous cases of polyneuritis have been reported following prolonged exposures to a petroleum fraction containing various isomers of heptane as major ingredients. May cause central nervous system disorder (e.g., narcosis involving a loss of coordination, weakness, fatigue) and/or damage.

Reproductive effects Benzene, xylene and toluene have demonstrated animal effects of reproductive toxicity. Animal studies of benzene have shown testicular effects, alterations in reproductive cycles, chromosomal aberrations and embryo/fetotoxicity. Ethanol has demonstrated human effects of reproductive toxicity. May damage fertility or the unborn child. Can cause adverse reproductive effects - such as birth defects, miscarriages, or infertility. Avoid exposure to women during early pregnancy. Avoid contact during pregnancy/while nursing.

Teratogenicity Abusive inhalation of toluene ("glue sniffing") has been reported to be associated with birth defects in the offspring of abusers. Rats exposed to benzene and xylene vapor during pregnancy showed embryo/fetotoxic effects. Ethanol has demonstrated human effects of teratogenicity.

Further information Symptoms may be delayed.

12. Ecological Information

Ecotoxicological data

Components		Species	Test Results
1,2,4, Trimethylbenzene (CAS 95-63-6)			
Aquatic			
Fish	LC50	Fathead minnow (Pimephales promelas)	7.19 - 8.28 mg/l, 96 hours
Benzene (CAS 71-43-2)			
Aquatic			
Crustacea	EC50	Water flea (Daphnia magna)	8.76 - 15.6 mg/l, 48 hours
Fish	LC50	Rainbow trout,donaldson trout (Oncorhynchus mykiss)	5.3 mg/l, 96 hours
Cumene (CAS 98-82-8)			
Aquatic			
Crustacea	EC50	Brine shrimp (Artemia sp.)	3.55 - 11.29 mg/l, 48 hours
Fish	LC50	Rainbow trout,donaldson trout (Oncorhynchus mykiss)	2.7 mg/l, 96 hours
Cyclohexane (CAS 110-82-7)			
Aquatic			
Fish	LC50	Fathead minnow (Pimephales promelas)	3.961 - 5.181 mg/l, 96 hours
Ethanol (CAS 64-17-5)			
Aquatic			
Algae	EC50	Freshwater algae	275 mg/l, 72 Hours
		Marine water algae	1970 mg/l
Fish	LC50	Fathead minnow (Pimephales promelas)	> 100 mg/l, 96 hours
		Freshwater fish	11200 mg/l, 96 Hours

Components		Species	Test Results
Invertebrate	EC50	Freshwater invertebrate	5012 mg/l, 48 Hours
		Marine water invertebrate	857 mg/l, 48 Hours
Ethylbenzene (CAS 100-41-4)			
Aquatic			
Crustacea	EC50	Water flea (Daphnia magna)	1 - 4 mg/l, 48 hours
Fish	LC50	Rainbow trout,donaldson trout (Oncorhynchus mykiss)	4 mg/l, 96 hours
n-Hexane (CAS 110-54-3)			
Aquatic			
Fish	LC50	Fathead minnow (Pimephales promelas)	2.101 - 2.981 mg/l, 96 hours
Toluene (CAS 108-88-3)			
Aquatic			
Crustacea	EC50	Water flea (Daphnia magna)	5.46 - 9.83 mg/l, 48 hours
Fish	LC50	Coho salmon,silver salmon (Oncorhynchus kisutch)	5.5 mg/l, 96 hours
Xylene (o, m, p isomers) (CAS 1330-20-7)			
Aquatic			
Fish	LC50	Rainbow trout,donaldson trout (Oncorhynchus mykiss)	8 mg/l, 96 Hours

Ecotoxicity Contains a substance which causes risk of hazardous effects to the environment.

Environmental effects The product contains a substance which is toxic to aquatic organisms and which may cause long-term adverse effects in the aquatic environment.

Aquatic toxicity Toxic to aquatic organisms. May cause long-term adverse effects in the aquatic environment.

Persistence and degradability Not available.

Bioaccumulation / Accumulation Not available.

Partition coefficient

Ethanol	-0.31
Benzene	2.13
Toluene	2.73
Ethylbenzene	3.15
Xylene (o, m, p isomers)	3.2
Pentane	3.39
Cyclohexane	3.44
Hexane (Other Isomers)	3.6
Cumene	3.66
n-Hexane	3.9
n-Heptane	4.66
Octane (All isomers)	5.18

13. Disposal Considerations

Waste codes D001: Waste Flammable material with a flash point <140 °F
D018: Waste Benzene

Disposal instructions Dispose in accordance with all applicable regulations. Dispose of this material and its container to hazardous or special waste collection point. Incinerate the material under controlled conditions in an approved incinerator. Do not allow this material to drain into sewers/water supplies. Do not contaminate ponds, waterways or ditches with chemical or used container.

14. Transport Information

DOT

Basic shipping requirements:

UN number UN1203

Proper shipping name Gasoline

Hazard class	3
Packing group	II
Additional information:	
Special provisions	139, B33, B101, T8
Packaging exceptions	150
Packaging non bulk	202
Packaging bulk	242

IATA

UN number	UN1203
UN proper shipping name	Gasoline
Transport hazard class(es)	3
Packing group	II
ERG code	3H

IMDG

UN number	UN1203
UN proper shipping name	Gasoline
Transport hazard class(es)	3
Packing group	II
EmS	F-E, S-E

TDG

Proper shipping name	GASOLINE; MOTOR SPIRIT; or PETROL, MARINE POLLUTANT
Hazard class	3
UN number	UN1203
Packing group	II
Marine pollutant	Yes
Special provisions	17

Re: Ecology Conditional Approval of the *SAP/QAPP for Point of Compliance Groundwater Monitoring*, Prepared by PIONEER Technologies Corporation, dated June 18, 2014, East Bay Redevelopment Site, Olympia, Washington, Agreed Order DE7830
Ecology Facility/Site No. 5785176
Cleanup Site ID No. 407.

Dear Ms. Smith, Mr. Burney, and Mr. Hielema:

Thank you for submitting the above-referenced revised work plan (plan) for our review in response to our May 7, 2014 comment letter. Ecology approves the plan provided that the following comment is incorporated:

- In addition to the planned sample from a depth of 1 to 3 feet below ground surface (bgs), please collect additional samples for laboratory analysis at boring DP57

below the 3 feet bgs depth in order to characterize the vertical depth of total petroleum hydrocarbons contamination at the DP08/DP57 location. Previously, only a single sample was analyzed from DP08 at the 1 to 3 feet bgs depth interval.

If you have any questions, please contact me at (360) 407-6247 or via e-mail at steve.teel@ecy.wa.gov.

Sincerely,

SS Teel

subject: SAP/QAPP for Point of Compliance Groundwater Monitoring
East Bay Redevelopment Site, Olympia, Washington
Agreed Order DE7830, Ecology Facility/Site No. 5785176, Cleanup Site ID No. 407

Dear Mr. Teel:

On behalf of the Port of Olympia (Port), PIONEER Technologies Corporation (PIONEER) has prepared this Sampling and Analysis Plan (SAP) / Quality Assurance Project Plan (QAPP) for conducting groundwater monitoring (GWM) activities at proposed point of compliance (POC) monitoring wells (MWs) at the East Bay Redevelopment Site (Site). The purpose of this proposed sampling is to supplement the remedial investigation (RI) / feasibility study (FS) report and subsequent remedy implementation activities.

1 Introduction

The approximately 15-acre Site is located in Olympia, Washington, on the southeast corner of the Port peninsula adjacent to the East Bay of Budd Inlet (Figure 1). This Model Toxics Control Act (MTCA) Site is currently being addressed under Agreed Order DE7830. Investigation activities at the Site have been ongoing since 2006. Two Washington State Department of Ecology (Ecology)-approved interim actions (IAs) have been completed for the Site: (1) the Infrastructure IA was completed within the infrastructure corridor in 2010, and (2) the Parcel 4/5 IA was completed within Parcels 4 and 5 in 2012. A RI/FS report for the entire Site is currently being prepared. Based on an initial assessment of the data, the RI/FS Report will likely identify four in-place soil sampling locations with remediation level (RL) exceedances (PIONEER 2013a, 2013b). These soil RL exceedances are arsenic in DP04, total petroleum hydrocarbons (TPH) in the gasoline range (TPH-G) and total naphthalenes in DP06 and SVP-2SO, and total chlorinated dibenzo-p-dioxins and chlorinated dibenzofurans (dioxins/furans) in MW24S (see Figure 1).[1] Ecology has requested the collection of additional groundwater data to further confirm the Port and PIONEER position that there are no soil RL exceedances associated with TPH in the diesel range (TPH-D) and TPH in the heavy oil range (TPH-HO) combined (Ecology 2013a, 2013b, 2014a; PIONEER 2013a, 2013b).[2]

A total of 26 monitoring wells (MWs) have been installed at the Site (see Figure 1) and a total of eight comprehensive GWM events have been conducted to date (PIONEER 2011). In general, there have been very few groundwater screening level (SL) exceedances in Site groundwater during these GWM events (PIONEER 2011). A 2011 evaluation demonstrated that arsenic and TPH-D and TPH-HO combined were the only constituents of potential concern (COPCs) with groundwater SL exceedances that potentially may be

[1] The soil RLs are expected to be 20 mg/kg for arsenic, 100 mg/kg for TPH-G, 5 mg/kg for total naphthalenes, and 0.00051 mg/kg for total dioxins/furans (PIONEER 2013a, 2013b).

[2] If additional groundwater data provides further confirmation that TPH-D and TPH-HO combined do not pose a concern for the soil-to-groundwater pathway, then it is anticipated that the soil cleanup level and soil RL for TPH-D and TPH-HO combined will be based on the direct contact pathway.

attributable to a release from Site soil (PIONEER 2011). The following locations have a groundwater SL exceedance or a soil-to-groundwater SL exceedance for these COPCs:

- Arsenic: MW24S (see Figure 1) is the only on-site MW with a dissolved arsenic exceedance (PIONEER 2011). The maximum dissolved arsenic concentration in MW24S was 12 ug/L (compared to the groundwater SL of 5.0 ug/L). DP04 (see Figure 1) is the only in-place soil sampling location with an arsenic soil concentration exceeding the 20 mg/kg soil-to-groundwater SL (PIONEER 2011, 2013a).[3]
- TPH-D and TPH-HO Combined: MW25S (see Figure 1) is the only on-site MW with a replicated exceedance for TPH-D and TPH-HO combined (PIONEER 2011). The maximum detected TPH-HO concentration in MW25S was 640 ug/L (compared to the current groundwater SL of 500 ug/L). TPH-D has never been detected in MW25S. TPH-D and TPH-HO combined were also detected at concentrations exceeding 500 ug/L in MW03, MW18, and MW24S during the December 2009 GWM event. However, the TPH-D and TPH-HO combined concentrations in MW03, MW18, and MW24S during the December 2009 GWM event are anomalous since TPH-D and TPH-HO have not been detected in these MWs during any other GWM events (with the exception of a TPH-D detection of 101 ug/L in MW24S during the August 2010 GWM event). In addition, the TPH-D and TPH-HO combined concentration of 1,750 ug/L in MW18 during the December 2009 GWM event, which is the highest TPH-D and TPH-HO combined concentration ever measured at the Site, is especially unusual since (1) there are no known TPH-D or TPH-HO sources upgradient of MW18, and (2) MW18 is tidally influenced (PIONEER 2011). The observed TPH-D and TPH-HO combined concentrations in MW03, MW18, and MW24S during the December 2009 GWM may be due to interferences associated with non-petroleum organic matter (Ecology 2011). DP02, DP04, DP08, DP13, MW22S, and MW25S (see Figure 1) are the only in-place soil sampling locations with combined TPH-D and TPH-HO soil concentrations exceeding 2,000 mg/kg (PIONEER 2011, 2013a).[4]

Based on recent RI/FS-related discussions between the Port and Ecology, the Port and Ecology agreed that additional GWM events would be helpful to supplement the RI/FS report and subsequent remedy implementation activities (Ecology 2013a, 2013b, 2014a; PIONEER 2013b). Specifically, additional GWM would help ensure compliance with soil cleanup levels, soil remediation levels, and groundwater cleanup levels for arsenic and TPH-D and TPH-HO combined. It is anticipated that the RI/FS report will establish a conditional groundwater POC at the eastern Site boundary in accordance with WAC 173-340-720(8)(c). A conditional groundwater POC is appropriate given the completed and anticipated cleanup actions, and the nature and extent of COPCs in fill material at the Site. Thus, this SAP/QAPP presents the plan for GWM activities that will be conducted in MWs along the anticipated groundwater POC. In addition, soil samples will be collected pursuant to this SAP/QAPP for potential use with establishing site-specific soil and groundwater cleanup levels for TPH-D and TPH-HO (Ecology 2014b; PIONEER 2014).

2 Sampling and Analysis Plan

2.1 PRE-MOBILIZATION PLANNING AND COORDINATION

Following approval of this SAP/QAPP and before the commencement of drilling-related fieldwork, PIONEER will complete the following pre-mobilization coordination activities:

[3] The arsenic soil-to-groundwater SL is the same value as the arsenic soil RL.

[4] The TPH-D and TPH-HO soil-to-groundwater SL of 2,000 mg/kg used in the 2011 soil-to-groundwater evaluation was based on the default residual saturation criteria in Washington Administrative Code (WAC) 173-340-747(10)(d)(i). However, in accordance with WAC 173-340-747(10)(c), the default residual saturation criteria does not apply since Site data has empirically demonstrated that Site soil concentrations have not caused an accumulation of light non-aqueous phase liquid (LNAPL) on or in groundwater (PIONEER 2011).

- Coordinate and subcontract (as necessary) with a licensed driller and licensed surveyor.
- Perform a public (i.e., Call Before You Dig) and private utility locate for the proposed MW and soil sampling locations.
- Ensure the licensed driller submits the applicable notices of intent and associated fees to Ecology's Water Resources Program.
- Submit a traffic management plan to the City of Olympia, and obtain supplies necessary to implement the traffic management plan (see Section 2.10).
- Arrange for the temporary storage and disposal of investigation-derived waste (IDW), as necessary.
- Coordinate with the project laboratory about the relevant details of the SAP/QAPP.
- Obtain equipment and supplies necessary to conduct the drilling-related fieldwork (e.g., soil sampling supplies, field turbidity meter).
- Notify the Ecology Site Manager at least one week prior to the anticipated fieldwork start date.
- Complete all necessary health and safety related pre-mobilization tasks per the health and safety plan.

Prior to commencement of each GWM event, PIONEER will complete the following pre-mobilization coordination activities:

- Coordinate with the project laboratory about the relevant details of the SAP/QAPP.
- Obtain equipment and supplies necessary to conduct the GWM event (e.g., interface probe, sampling pump, tubing).
- Re-submit the traffic management plan to the City of Olympia and/or notify the City of Olympia about the traffic management plan, and obtain supplies necessary to implement the traffic management plan (see Section 2.10).
- Arrange for the temporary storage and disposal of IDW, as necessary.
- Notify the Ecology Site Manager at least one week prior to the anticipated fieldwork start date.
- Complete all necessary health and safety related pre-mobilization tasks per the health and safety plan.

2.2 MW INSTALLATION, DEVELOPMENT, AND SURVEYING

MW26 and MW27 will be installed by a licensed Washington driller in accordance with Chapter 173-160 WAC Part II. The proposed locations of MW26 and MW27 are shown in Figure 1 (although the actual locations may need to be adjusted slightly based on utilities, access, and other field considerations). A truck-mounted direct-push or hollow-stem auger drill rig will be used to drill the borehole for each MW. Each borehole will be advanced approximately five to 10 feet below where groundwater is first encountered. Groundwater is expected to be encountered between approximately four to 12 feet below ground surface (bgs) in the vicinity of MW26 and MW27. Following each borehole advancement, a MW consisting of thread-coupled, flush-joint, two-inch diameter polyvinyl chloride (PVC) casing, 10 feet of 10-slot PVC screen, and a sand filter pack extending at least one-foot above the top of the screen will be constructed within the borehole. The MW screen will be placed at or near the bottom of the borehole so the screened interval straddles the depth at which groundwater was encountered, while taking into account anticipated seasonal and tidal fluctuations. Each MW will be sealed in accordance with WAC 173-160-450. In general, this MW sealing entails installing a bentonite plug above the top of the filter pack, filling the borehole annulus from the bentonite plug to near the land surface with bentonite or cement, and then installing a concrete surface seal. Flush-mount surface completions are planned. Each MW will be developed by overpumping with a submersible pump and/or hand bailing until the turbidity in the development water is less than 10 nephelometric turbidity units (NTU). If it is clearly not practical to continue development to reach the 10 NTU goal, then a development goal of 50 NTU will be used instead. A calibrated field turbidity meter will be used to measure the turbidity. PIONEER field personnel will log borehole lithology, MW construction details, and MW development activities using the forms included in Attachment 1.

A licensed surveyor will determine the vertical and horizontal location of the MW reference point (notch or mark, or north side of the top of PVC casing if no notch or mark) for MW26 and MW27. The vertical elevation will be surveyed to an accuracy of 0.01-foot with the North American Vertical Datum of 1988 (NAVD88). The horizontal accuracy will be approximately 1 foot. In addition, since the existing MWs had previously been surveyed to the National Geodetic Vertical Datum of 1929, the reference point for all existing MWs (see Figure 1) will be re-surveyed using NAVD88. The vertical and horizontal accuracy will be the same as specified above for MW26 and MW27.

2.3 DECOMMISSIONING MW24S

While a drill rig is on-site to install MW26 and MW27, a licensed Washington driller will also decommission MW24S in accordance with WAC 173-160-460. MW24S is being decommissioned to facilitate anticipated future soil removal activities associated with a soil RL exceedance in a MW24S soil sample.

2.4 DP57 AND DP58 SOIL SAMPLING AND ANALYSIS PROCEDURES

While a drill rig is on-site to install MW26 and MW27, a licensed Washington driller will also advance soil borings DP57 and DP58. DP57 and DP58 will be co-located with former soil borings DP08 and DP13, respectively (see Figure 1). A soil sample will be collected from DP57 at a depth of approximately one to three feet bgs, and a soil sample will be collected from DP58 at a depth of approximately four to six feet bgs (Ecology 2014b; PIONEER 2014). Soil samples for volatile analyses (i.e., volatile petroleum hydrocarbons [VPH] and benzene, toluene, ethylbenzene, and xylenes [BTEX]) will be collected using United States Environmental Protection Agency (USEPA) Method SW846-5035. PIONEER field personnel will log borehole lithology and soil sampling activities using the forms included in Attachment 1.

Both soil samples will be analyzed for petroleum hydrocarbons in the range analyzed by Ecology Method NWTPH-Dx (e.g., TPH-D, TPH-HO) as determined by prior analysis using Ecology Method NWTPH-HCID. In addition, both samples will be analyzed for VPH using Ecology Method NWVPH, extractable petroleum hydrocarbons (EPH) using Ecology Method NWEPH, BTEX by USEPA Method SW846-8260 or SW846-8021, and polycyclic aromatic hydrocarbons (PAHs) by USEPA Method SW846-8270.[5] All samples will be analyzed by an Ecology accredited laboratory. It is anticipated that Anatek Labs (which is an Ecology accredited laboratory for the analyses being performed) will perform the analyses. Sample containers will be provided by the project laboratory. Table 2 presents the sample containers, preservatives, and holding times for these analyses.

2.5 GWM LOCATIONS AND FREQUENCY

Groundwater measurements and groundwater samples will be collected from MW12, MW18, MW26, and MW27 during each GWM event (see Figure 1). In addition, groundwater measurements will be collected from existing interior MWs (i.e., MW02R, MW07, MW08, MW09, MW10, MW13, MW14, MW15, MW20, MW21S, MW22S, MW25S) in order to generate groundwater elevation contour maps for each GWM event (see Figure 1). The initial GWM frequency for these activities will be quarterly. If there are no groundwater SL exceedances during the first four quarters of GWM, the GWM frequency will be decreased in consultation with Ecology. Table 1 presents a summary of this GWM design.

2.6 GROUNDWATER MEASUREMENT PROCEDURES

During each GWM event, the static water level and any measurable LNAPL thickness will be measured in MW02R, MW07, MW08, MW09, MW10, MW12, MW13, MW14, MW15, MW18, MW20, MW21S, MW22S,

[5] The PAH constituents will include naphthalenes and carcinogenic PAHs (cPAHs).

MW25S, MW26, and MW27 using an electronic interface probe. The depth to water and any LNAPL thickness will be recorded to the nearest 0.01 foot from a consistent reference point (e.g., mark on the top of the MW casing). Groundwater measurements will be collected as synoptically as possible (e.g., all groundwater measurements will be collected within an approximately two hour period prior to groundwater sample collection).

2.7 GROUNDWATER SAMPLING AND ANALYSIS PROCEDURES

The following low-flow purging standard operating procedures will be used to purge water from each MW being sampled (i.e., MW12, MW18, MW26, and MW27). A peristaltic pump, equipped with dedicated polyethylene tubing, will be used to purge water from the MW. The tubing intake will be positioned approximately two feet above the bottom of the MW screen. A variable-frequency drive controller on the pump will be used to limit the purging flow rate to less than one liter per minute. During purging, relative water levels will be monitored with an interface probe or electronic water level indicator, and water quality parameters such as pH, specific conductivity, turbidity, dissolved oxygen, temperature, oxidation/reduction potential, and salinity will be measured with a calibrated water quality meter(s) to verify stabilization. Acceptable stabilization criteria are listed on the Groundwater Monitoring Form included in Attachment 1 (USEPA 2002). Groundwater samples will be collected immediately after the field measurements have stabilized without turning off the pumping system. In the event that drawdown is excessive or that water quality parameters do not stabilize, then the MW will be purged until three well volumes have been removed or the pump intake is covered by less than two feet of water, whichever occurs first. Sampling will be timed so that groundwater samples are collected as close to low tide as possible. In addition, since there have been instances during previous GWM events in which MW12 and MW18 did not contain enough water for sampling during low tides, sampling days should be timed to collect samples during low tides that are relatively high.

Each groundwater sample will be analyzed for total arsenic and dissolved arsenic by USEPA Method 200.8, and petroleum hydrocarbons in the range analyzed by Ecology Method NWTPH-Dx (e.g., TPH-D, TPH-HO).[6] All samples will be analyzed by an Ecology accredited laboratory. It is anticipated that Anatek Labs (which is an Ecology accredited laboratory for the analyses being performed) will perform the analyses. Sample containers will be provided by the project laboratory. Table 2 presents the sample containers, preservatives, and holding times for these analyses. The laboratory will perform the following preparation activities prior to analyzing these groundwater samples:

- The laboratory will filter each sample for dissolved arsenic analysis with a 0.45-micron filter.
- The laboratory will perform silica gel cleanup on each sample for NWTPH-Dx analysis.

2.8 EQUIPMENT DECONTAMINATION PROCEDURES

Non-dedicated drilling and GWM equipment (e.g., drill rods, interface probe) will be decontaminated in accordance with the following procedures:

- All non-dedicated equipment will be cleaned before use.
- Following use at each monitoring location, the affected portions of non-dedicated equipment will be scrubbed with potable water containing diluted detergent (e.g., Liquinox) before being sufficiently rinsed with potable water.
- Nitrile gloves will be changed before working at each sampling location.
- Dedicated sample tubing for each MW will be stored in dedicated plastic bags to prevent cross-contamination.

[6] During the first GWM event, each sample will be analyzed using Ecology Method NWTPH-HCID prior to NWTPH-Dx to determine which NWTPH-Dx product(s) to report.

2.9 INVESTIGATION-DERIVED WASTE

IDW will be managed and disposed of as follows:

- Drill cuttings will be containerized in a labeled drum, temporarily stored at a secure on-site location, and disposed of at an off-site facility permitted to receive such waste.
- Water generated during MW development, MW purging, and decontamination activities will be containerized in a labeled container, temporarily stored at a secure on-site location, and discharged to the LOTT Clean Water Alliance sanitary sewer in coordination with LOTT Clean Water Alliance. If water-related IDW cannot be discharged to the LOTT Clean Water Alliance sanitary sewer during a particular GWM event for some reason, it will be disposed of at an off-site facility permitted to receive such waste.
- Personal protective equipment (e.g., nitrile gloves) and other disposable drilling and sampling equipment will be disposed of as solid waste in the standard municipal solid waste stream.

2.10 TRAFFIC MANAGEMENT PLAN

Since the MW installation and/or GWM activities will likely involve obstructing City of Olympia sidewalks and/or road shoulders, a traffic management plan will be prepared and submitted to the City of Olympia. The traffic management plan will be implemented for all MW installation and GWM activities, as necessary. Based on similar previous Site activities, it is anticipated that the traffic management plan will entail closing isolated sidewalk sections and isolated road shoulders, and communicating those closures to the public with United States Department of Transportation (USDOT) approved road signs.

2.11 FIELD RECORDKEEPING

The four field forms included in Attachment 1 (i.e., Field Checklist, Daily Field Report, Boring Log/MW Installation Form, and Groundwater Monitoring Form) will be used to document field activities. The Field Checklist form is used to assist with planning and coordination prior to a field event. The Daily Field Report is used to document miscellaneous field activities and notes on a daily basis. The Boring Log/MW Installation Form is used to record drilling, MW installation, and MW development details. The Groundwater Monitoring Form is used to record and maintain monitoring, purging, sampling, and waste disposal data associated with GWM.

2.12 SAMPLE LABELING, HANDLING, AND SHIPMENT

Sample labels will clearly indicate the Site location, sample identification, date, time, sampler's initials, parameters to be analyzed, and added preservative (if any). Each sample will be individually labeled. Each sample identification will be unique. Sample nomenclature for primary soil samples, primary groundwater samples, and field quality control (QC) samples will be as follows:

- Primary soil samples: SO-DP-ID-sample date-top depth-bottom depth
- Primary groundwater samples: GW-MW-ID-sample date
- Soil trip blank samples: TB-TB-ID-sample date
- Field duplicate groundwater samples: GW-MW-ID-sample date-(01)

Sample packaging and shipping procedures are based on USEPA specifications and USDOT regulations as specified in 49 Code of Federal Regulations (CFR) 173.6 and 49 CFR 173.24. Samples will be shipped as environmental samples and not hazardous material. Samples will be shipped express delivery to the laboratory following sample collection using standard operating procedures.

2.13 CHAIN-OF-CUSTODY DOCUMENTATION

Chain-of-custody procedures will be followed to maintain and document sample possession. A sample is considered under a person's custody if it is in that person's physical possession, within visual sight of that person after taking physical possession, secured by that person so that the sample cannot be tampered with, or secured by that person in an area that is restricted to unauthorized personnel.

The originator (the sampler) will complete requested information on the custody record, including signature and date. Original signed custody records listing the samples in the cooler will accompany sample shipments. The originator of the custody record will retain a copy of the custody record.

3 Quality Assurance Project Plan

3.1 FIELD QUALITY CONTROL SAMPLES

For the DP57 and DP58 soil sampling and analysis, one trip blank sample will be analyzed for VPH and BTEX. During each GWM event, one groundwater field duplicate will be collected and analyzed for the same constituents as the primary samples.

3.2 LABORATORY QUALITY CONTROL

The project laboratory will be responsible for conducting laboratory QC procedures and reporting laboratory QC results in accordance with the laboratory's standard operating procedures. Laboratory QC analyses include method blanks, laboratory control samples (also known as blank spikes), matrix spikes, matrix spike duplicates, and surrogates. Expectations for laboratory control limits are shown in Table 3.

3.3 LABORATORY TARGET REPORTING LIMITS

Table 4 presents a comparison of target reporting limit expectations with current SLs. As shown in Table 4, the target reporting limits are less than or equal to these SLs.

3.4 DATA QUALITY REVIEW

Data quality will be reviewed following receipt of the analytical data from the project laboratory. Project data and QC data (e.g., lab QC results, actual RLs, holding times) will be reviewed in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity. Corrective action will be taken for field or laboratory procedures as necessary.

4 Schedule and Relationship with RI/FS Report

The anticipated schedule for this proposed work and the relationship of the proposed work to the RI/FS report is as follows:

- Drilling-related fieldwork activities (i.e., installation and development of MW26 and MW27, decommissioning of MW24S, soil sampling at DP57 and DP58) will commence within one month of receiving Ecology approval of this SAP/QAPP, subject to driller availability and City of Olympia approval of a traffic management plan.
- The first GWM event will commence within two weeks of completion of the drilling-related fieldwork described in the previous bullet.
- The second GWM event will commence approximately three months after the first GWM event.
- If, as expected, there are no groundwater SL exceedances in samples collected during the first and second GWM events, the draft RI/FS report will be submitted to Ecology within six weeks after receipt of

the analytical results from the second GWM event. However, if there are groundwater SL exceedances in samples collected during the first and/or second GWM events, then the Port and Ecology will meet to discuss a path forward for GWM and preparation of the draft RI/FS report.

- The third GWM event will commence approximately three months after the second GWM event.
- The fourth GWM event will commence approximately three months after the third GWM event.
- A report will be prepared to document MW installation and GWM activities through the first four GWM events. It is anticipated that this report will be a standalone addendum to the RI/FS report.
- The frequency of future GWM events (if any) will be determined based on the results of the first four GWM events and the recommended remedy in the RI/FS report.

Table 4: Target Reporting Limits

Category	Analytical Method	Constituent	Target Reporting Limit [1]	Current Screening Level [2]
Soil constituents that may be used to establish site-specific soil and groundwater cleanup levels for TPH-D and TPH-HO	Ecology Method NWTPH-Dx	TPH-D	25 mg/kg	2,000 mg/kg [3]
		TPH-HO	100 mg/kg	
	USEPA Method SW846-8260 or SW846-8021	Benzene	0.005 mg/kg	0.22 mg/kg
		Toluene	0.005 mg/kg	240 mg/kg
		Ethylbenzene	0.005 mg/kg	43 mg/kg
		Total xylenes	0.010 mg/kg	23 mg/kg
	USEPA Method SW846-8270	Total naphthalenes	0.15 mg/kg	160 mg/kg
		Total cPAHs	0.076 mg/kg [4]	0.095 mg/kg
Groundwater constituents included in ongoing GWM	USEPA Method 200.8	Total arsenic	1.0 ug/L	Not applicable [5]
		Dissolved arsenic	1.0 ug/L	5.0 ug/L
	Ecology Method NWTPH-Dx	TPH-D	100 ug/L	500 ug/L [3]
		TPH-HO	500 ug/L	

Notes:

[1] It may not always be possible to achieve target reporting limits for reasons such as matrix interferences, necessary dilution prior to analysis, etc.

[2] The soil screening levels are from the 2009 interim action work plan associated with the infrastructure corridor (PIONEER 2009). The groundwater screening levels are the surface water screening levels from the 2011 empirical evaluation of the soil-to-surface water via groundwater pathway (PIONEER 2011).

[3] The concentrations of TPH-D and TPH-HO are currently being combined per Ecology direction (Ecology 2013a, 2013b). However, NWTPH-HCID analyses will be conducted pursuant to this SAP/QAPP to inform the nature of petroleum products present at the Site so that it can be determined if TPH-D and TPH-HO should be combined or separated.

[4] The target reporting limit is 0.05 mg/kg for each PAH constituent. The target reporting limit shown is a total cPAHs target reporting limit by applying the toxicity equivalency factors in WAC 173-340-708(8) for the seven cPAH constituents.

[5] Compliance with groundwater screening levels for metals is being evaluated using dissolved concentrations (PIONEER 2011).

Subject: Data Gap Work Plan for Evaluating Methane in Soil Gas at the East Bay Redevelopment Site
Agreed Order DE7830, Ecology Facility/Site No. 5785176

Dear Mr. Teel:

On behalf of the Port of Olympia (Port), PIONEER Technologies Corporation (PIONEER) has prepared for your review this work plan (Work Plan) to determine whether or not methane poses a safety concern[1] at the East Bay Redevelopment Site (Site). The approximately 15acre Site is located in Olympia, Washington, on the southeast corner of the Port peninsula adjacent to East Bay of Budd Inlet. This Model Toxics Control Act (MTCA) Site is currently being addressed under Agreed Order DE7830.

Background

Methane is a colorless, odorless, naturally-occurring and man-made gas[2] and is generally not toxic to humans (other than as an asphyxiant). However, methane is flammable and can be explosive under certain conditions which can result in significant safety concerns for overlying buildings and confined spaces. Historically, methane has been a concern at oil and gas fields and sanitary landfills. However, methanogenesis (i.e., the formation of methane by microbes known as methanogens) has also been observed in some anoxic environments where organic matter is present (e.g., swamps/bogs, organic fill, et cetera). Methane is potentially a concern at the Site because:

1. The Site is built on fill material.
2. Significant quantities of wood debris have been observed in some areas of the Site.
3. Anoxic conditions potentially exist at the Site in subsurface soil overlying shallow groundwater which is typically present from two to eight feet below ground surface (bgs).

These conditions suggest that it is possible that methane could

Methane Gas Generation is Typically Positively Pressurized and Transport Differs from Typical Chlorinated-Vapor Intrusion Sites (e.g., Dry Cleaners)

Methane that is generated in the subsurface is typically positively pressurized which means that methane migration is predominantly driven by pressure driven flow, advection, and diffusion. This is different than typical vapor intrusion sites (e.g., dry cleaners) where movement of volatile organic compounds (VOCs) , such as tetrachloroethylene, is driven by advection and diffusion. Consequently, one of the lines of evidence used in screening potential methane sites is whether or not positive pressure (with respect to atmospheric pressure) is present in the subsurface. Positive pressure indicates that methane gas (or other gas) is potentially being generated in the subsurface.

In addition, the concentrations of typical concern for methane are in the percent (volume/volume) versus parts per billion range for some VOCs. Consequently, the methods used to evaluate sites for methane are not a sensitive nor do they have to be as precise as typical vapor intrusion sites.

---

[1] Methane is flammable and/or explosive if the correct mixture of methane and oxygen is present with an ignition source.

[2] Under typical ambient temperature and pressure.

be produced at the Site and potentially pose a safety concern for current/future buildings and confined spaces at the Site.

Description of Sampling and Analysis

This work plan follows the American Society for Testing and Materials (ASTM) Three Tiered Approach for evaluating multiple lines of evidence to determine whether or not methane is a concern and warrants a remedial response at a site(ASTM 2016). The Three Tiered Approach is summarized below:

- **Tier 1 –** Consists of a site evaluation using existing data. Information is compiled and reviewed to determine the source of any methane that is present, vadose zone conditions (e.g., depth-to-groundwater/soil type), size of impacted area, locations of buildings, confined spaces, and any other relevant lines of evidence needed to provide an initial assessment of the potential hazard. If the Tier 1 assessment indicates that methane is a potential concern at a site, then the site proceeds to Tier 2. If the Tier 1 assessment indicates that methane is not a potential concern at a site then the site does not proceed to Tier 2 and exits the evaluation process.
- **Tier 2 –** Consists of field work that is intended to address data gaps in the information obtained during the Tier 1 assessment. For example, there may be limited methane data available from Tier 1 because few locations were sampled for methane or there was limited spatial coverage of methane sampling. The field work performed during Tier 2 is intended to address those data gaps and provide other lines of evidence so that a comprehensive/site-specific assessment of methane can be performed. Another line of evidence that is typically collected during a Tier 2 assessment is the differential pressure measurements between the subsurface and ambient air.
- **Tier 3 –** Special case evaluation. The need and scope of the Tier 3 evaluation is determined on a site-by-site basis.

Tier 1 Evaluation Results

A Tier 1 assessment has been conducted for the Site. As noted in the Background section of this memo, methane is a potential concern at the Site because: (1) the Site is built on fill material, (2) significant quantities of wood debris have been observed in some areas of the Site, and (3) there are areas of the Site with anoxic conditions in subsurface soil overlying shallow groundwater which is typically present from two to eight feet bgs. These conditions suggest that it is possible that methane could be produced at the Site and may pose a safety concern for current/future buildings and confined spaces at the Site. In addition, methane samples were collected from two soil vapor probes in 2013 and the results indicate that methane may be present at some locations of the Site (see Figure 1). Consequently, this Site has proceeded to Tier 2.

Tier 2 Sampling and Analysis Plan for Methane

Sample Locations

To determine whether or not methane poses a safety concern at the Site, twenty-one (21) subsurface soil gas samples and one (1) indoor air sample are proposed for the Tier 2 assessment. The proposed sampling locations are presented in Figure 2 and were determined as follows:

- Initial sample locations were plotted using a 100 foot grid to establish initial sampling coverage which is consistent with California Department of Toxic Substances Control (CADTSC) Advisory on Methane Assessment and Common Remedies at School Sites (CADTSC 2005).

These initial sample locations from the 100 foot grid were then adjusted as follows:

- Sample locations in some areas were relocated based on the percentage of wood debris in the area (a higher percentage of wood debris may indicate a higher probability of detecting methane).
- Sample locations in some areas were relocated based on the depth-to-groundwater. The goal was to collect samples from locations where the depth-to-groundwater was at least five feet bgs; however, in some cases obtaining optimal spatial coverage overrode the depth-to-groundwater goal.
- Sample locations that were in roads, 1982 fill, and existing building footprints were removed.
- One sample location was added in the 1982 fill to confirm that methane is not in the fill (methane is not expected in the 1982 fill because there is very little organic matter in the fill material) per a request from Ecology.
- One sample location was added in the parking lot located immediately north of the Hands on Children's Museum per a request from Ecology.
- One indoor air sample location was added in the restroom facility located at the Port Plaza which is located immediately south of the Hands on Children's Museum per a request from Ecology.

Sample Collection, Analyses, and Data Quality Objectives

Subsurface soil gas samples, indoor air samples, depth-to-groundwater, and other lines of evidence will be collected during the Tier 2 assessment. The subsurface soil gas and indoor air samples will be collected as follows[3,4]:

Subsurface Soil Gas Sample Collection

- Prior to collecting methane samples, the depth-to-groundwater will be determined at each sample location by advancing a rod with a 2.5" split spoon to determine actual depth-to-groundwater at the location.
    - If the depth-to-groundwater is > 2', a temporary soil vapor probe (SVP) will be installed using Geoprobe 1.5" Post Run Tubing [PRT] system (see Figure 3 and Figure 4). Each temporary SVP will be installed by a Washington licensed driller. The driller will clean the PRT tip threads and seat daily (or more frequently if needed), and will change the PRT O-ring daily. Rods equipped with a PRT point holder and expandable drive point will be driven to a depth where the top of the drive point is five feet bgs or approximately six inches above the water table at locations where the depth-to-groundwater is less than five feet bgs. Before the rods are pulled back, rigid-walled, ¼-inch-diameter dedicated Poly (or similar) tubing and a PRT adapter will be inserted down the rod bore and rotated to form a vacuum tight connection at the point holder. This will result in continuous tubing from the sample level to the surface. The above

[3] A utility locate will be performed prior to performing subsurface activities.

[4] Samples will be collected on a rising tide, if possible. These conditions are expected to maximize the pressure of methane in the subsurface as the rising tide will cause the water table to rise, which will force air/gas in the subsurface upward and force it to occupy a smaller area in the vadose zone.

ground (i.e., sampling end) of the Poly tubing will be equipped with a one-way fitting to prevent ambient air from entering the tubing. The ground surface surrounding the SVP will be sealed with bentonite to minimize gas exchange with the ambient air.

- Once soil gas soil samples have been collected, the driller will decommission all SVP borings by backfilling the boreholes with bentonite chips and hydrating the bentonite chips.

- If the depth-to-groundwater is < 2', a temporary soil vapor flux chamber will be installed using a 5-gallon plastic bucket equipped with dedicated Poly tubing. The flux chamber will be installed six inches above the depth-to-groundwater and the circumference of the chamber will be packed with native soil (see Figure 5).

- A Landtech GEM 2000 Gas Analyzer and Extraction Monitor (GEM 2000) will be connected to the above ground (i.e., sampling end) of the Poly tubing (either from the SVP or flux chamber). Methane, differential pressure, oxygen, and carbon dioxide will be collected at each sampling location using the GEM 2000. Hydrogen sulfide will be measured at each location using a BW Gas Alert Extreme H2S - Model GAXT-H-2 (BW H2S). This handheld device has a detection limit of one ppm.
  - SVP Locations: Samples will be collected using the GEM 2000 immediately[5] after the SVP has been installed and will be collected over a five minute period depending on the time it takes the methane, oxygen, and differential pressure readings to stabilize (typically this is 10 to 30 seconds [CADRRR 2014]).

Determining the Equilibration Time Used for SVP Sampling

The first SVP sample will be collected from Parcel 7 at the location where 42% methane was previously detected in soil gas (see Figure 1). At this location, multiple measurements will be collected using the GEM 2000 and BW H2S from the SVP in order to assess whether or not equilibration time has a significant impact on the results. Consequently, GEM 2000 samples and BW H2S samples will be collected at this location over a one hour-period as follows:

1. Immediately after Installation of the SVP
2. 30 Minutes after Installation of the SVP
3. 60 Minutes after Installation of the SVP

The data/information obtained from this sampling will be used to determine the equilibration time that will be used for all subsequent soil gas samples collected from SVPs at the Site.

**In addition to the above, a Summa canister sample will be collected from this location at after all GEM 2000 samples have been collected.

[5] As noted in the callout on this page, the equilibration time before sampling will be 0 minutes (i.e., immediately after completion of the SVP), 30 minutes, or 60 minutes, depending on the stabilization results obtained from the test performed at the first SVP that is installed at the site. If acceptable results are obtained with 0 minutes of equilibration, then this result will be used for all other SVP locations. If more time is required to obtain acceptable results (e.g., 30 minutes or 60 minutes), then all subsequent SVP samples will be collected after the SVP has equilibrated for the indicated time (i.e., 30 minutes or 60 minutes).

- At select SVP locations (minimum of two and maximum of four locations), Summa canisters will be used to collect samples for offsite laboratory analysis. The Summa canisters will be used to evaluate the precision and accuracy of the GEM 2000. It is anticipated that the Summa canister samples will be collected from the locations with the highest methane concentrations as determined by the GEM 2000. The samples will be collected using a 1-liter Summa canister and a laboratory-supplied regulator set for a flow rate between 100-200 milliliters per minute. Sampling will stop when the remaining canister vacuum gauge is approximately three to five inches of mercury. The final canister vacuum will be recorded on the chain-of-custody.
    - The Geoprobe PRT system will be left in the ground for at least one hour prior to collecting the Summa canister samples only to allow the subsurface system to reach equilibrium after potential disturbance due to advancing the Geoprobe PRT.
    - The Summa canisters samples will be analyzed for methane, carbon dioxide, oxygen, and nitrogen using ASTM D-1946.
        - Table 1 presents the target reporting limits and screening levels.
        - Table 2 presents the appropriate sample containers and holding times for the soil gas samples. Sample containers will be provided by the analytical laboratory and each canister will be individually certified clean by the laboratory to the target reporting limits. Prior to field mobilization, the initial canister vacuums measured by the laboratory will be verified to ensure a vacuum of approximately 30-inches of mercury. Canisters with an initial vacuum of less than 25 inches of mercury will be returned to the laboratory for a replacement canister. It is anticipated that the analysis will be performed by Eurofins Air Toxics, Inc. (Air Toxics), which is an Ecology accredited laboratory. It is expected at a minimum that Air Toxics will perform and report the following laboratory quality control analyses once per batch of soil gas samples: method blank, and laboratory control sample. It is also expected that the laboratory will perform and report results of surrogate recovery for every sample, as applicable.
        - Table 3 presents the expectations for laboratory control limits.
        - Table 4 presents the anticipated deviations from the original Sampling and Analysis/Quality Assurance Project Plan (SAP/QAPP). The original SAP/QAPP for this Site was prepared by GeoEngineers in 2008 (GeoEngineers 2008).

- Flux Chamber Locations: Samples will be collected using the GEM 2000 one hour[6] after the Flux Chamber has been installed. Samples will be collected over a five minute period depending on the time

[6] As noted in the callout on the follow page, the equilibration time before sampling will be one hour, two hours, three hours, or four hours, depending on the stabilization results obtained from the test performed at the first Flux Chamber that is installed at the site. If acceptable results

it takes the methane, oxygen, and differential pressure readings to stabilize (typically this is 10 to 30 seconds [CADRRR 2014]). Hydrogen sulfide will be measured at each location using the BW H2S. This handheld device has a detection limit of one ppm.

Determining the Equilibration Time Used for Flux Chamber Sampling

The first Flux Chamber sample will be collected over a four hour period in order to assess whether or not equilibration time has a significant impact on the results. Consequently, GEM 2000 samples and BW H2S samples will be collected at this location over a four hour-period as follows:

- One hour after installation of the Flux Chamber
- Two hours after installation of the Flux Chamber
- Three hours after installation of the Flux Chamber
- Four hours after installation of the Flux Chamber

The data/information obtained from this sampling will be used to determine the equilibration time that will be used for all subsequent collected from Flux Chamber samples at the Site.

- Stabilization will be determined as follows:

Constituent	Stabilization Criteria
Methane	+/-20%
Oygen	+/-20%
Carbon Dioxide	Not Used for Stabilization Critieria
Pressure Differenital	+/-20%
Hydrogen Sulfide	+/-20%

Indoor Air Sample Collection

Indoor air samples will be collected from zero to six inches above the ground surface throughout the perimeter of the building using the BW Gas Alert Max XT II – Model D6558 with CH4 only. This handheld device has a methane detection limit of one ppm. In addition, any locations with floor penetrations (e.g., utility pipes) or cracks will be sampled for methane. Each room on the ground floor of the building will be sampled and the results will be recorded in field notes on a room by room basis.

are obtained with 1 hour of equilibration, then this result will be used for all other Flux Chamber locations. If more time is required to obtain acceptable results (e.g., two hours, three hours, or four hours), then all subsequent SVP samples will be collected after the SVP has equilibrated for the indicated time (i.e., two hours, three hours, or four hours).

Data Management, Analysis, and Reporting

Data Management and Analysis

The data recorded in completion of this work will include field screening data and analytical laboratory data. All data will be compiled, organized, and assessed for usability by comparing the results (e.g., detection limits) to the data quality objectives. The data will be analyzed and the need for further action will be determined by comparing the results to the following ASTM criteria (ASTM 2016):

Suggested Default Decision Matrix for Methane in Soil Gas and Indoor Air (ASTM 2016)

Shallow Soil Gas Concentration ↓	Indoor Air Concentration →			
	No Measurements Available	**Methane Concentration < 0.01%**	**Methane Concentration 0.01% to < 1.25%**	**Methane Concentration > 1.25%**
Methane Concentration <1.25% to 5%	No Further Action	No Further Action	No Further Action	Immediately notify authorities, recommend that owner/operator evaluate building.
Methane Concentration > 5% to 30%	No further action unless Pressure Differential > 500 Pascals	No further action unless Pressure Differential > 500 Pascals	No further action unless Pressure Differential > 500 Pascals	
Methane Concentration > 30%	Collect indoor air data	Evaluate on a case-by-case basis	Evaluate on a case-by-case basis	

Reporting

A brief technical memorandum will be submitted to Ecology after the data have been received and analyzed and will include the following:

1. Narrative text.
2. Tables/Figures presenting/summarizing sampling locations and sampling results (e.g., methane concentrations and differential pressure results).
3. Field sampling records, analytical laboratory reports, and photo documentation.

The report narrative will identify and describe any deviations from or modifications to the Work Plan. It will include an assessment of whether or not methane poses a safety concern at the Site based on ATSM criteria (ASTM 2016).

Schedule

Following review and approval of this Work Plan by Ecology, PIONEER will collect samples September 28 through September 30, 2016.

TABLES

Table 1: Target Reporting Limits and Screening Levels

Constituent	Soil Gas, Indoor Air, and Ambient Air		
	Analytical Method	Soil Gas, Indoor Air, and Ambient Air Target Reporting Limits (volume/volume)	Soil Gas Screening Level (volume/volume)
Methane	ASTM D1946	0.0001%	4.4%
Oxygen	ASTM D1946	0.1 %	N/A
Carbon Dioxide	ASTM D1946	0.01 %	N/A
Nitrogen	ASTM D1946	0.1 %	N/A

Notes:

N/A : not applicable

There are not screening levels available for oxygen, carbon dioxide, and nitrogen. These analytes are non-toxic.

Methane is a colorless, odorless, naturally-occurring and man-made gas and is generally not toxic to humans (other than as an asphyxiant). However, methane is flammable and can be explosive under certain conditions. Therefore, the screening level for methane is based on the lower explosive limit of methane which is 4.4% (volume/volume).

Table 2: Sample Containers, Preservation, and Holding Times

Constituent	Media	Analytical Method	Sample Container	Preservative	Extraction Holding Time (days)	Analysis Holding Time (days)
Methane Oxygen Carbon Dioxide Nitrogen	Soil Gas, Indoor Air, and Ambient Air	ASTM D1946	1-liter evacuated SUMMA® canister, individually certified clean by the laboratory, equipped with a Swagelok 1/4-inch stainless steel bellows valve, brass cap, particulate filter, and vacuum gauge. Regulator shall be adjusted for a flow rate between 100-200 milliliters per minute.	None	N/A	30

Table 3: Laboratory Control Limits

Constituent	Media	Analytical Method	LCS (%R)	Acceptance Criteria		Surrogates (%R)
				ICV/LCS (%R)	Precision Limits (Max RPD)	
Methane Oxygen Carbon Dioxide Nitrogen	Soil Gas, Indoor Air, and Ambient Air	ASTM D1946	85-115	85-115	≤ 25	85-115

Notes:

Information provided by Eurofin Air Toxics, Inc.

ICV: initial calibration verification

LCS: laboratory control sample (also known as blank spike)

%R: percent recovery

RPD: relative percent difference

Table 4: Sampling Deviations from the Sampling and Analysis Plan/Quality Assurance Project Plan

Section	Deviation	Rationale/Explanation
2.0	Investigation derived waste will be handled differently.	It is anticipated based on previous sampling events that an insignificant volume of decontamination water will be generated and therefore will be discharged on site. It is anticipated based on previous sampling events that an insignificant volumed of unused soil cores will be generated. These soils will be placed on-site.
4.0	Work will be executed by PIONEER rather than GeoEngineers.	The Port of Olympia selected PIONEER to perform this work.
5.2	A different GPS unit will be used.	PIONEER has a different GPS unit (which is more accurate than the unit specified in the SAP/QAPP).
8.0	Sample nomenclature will be revised.	To improve data usability during subsequent data evaluations.
Table 4	Different target reporting limits will be used.	Reporting limits for the analytical methods and anticipated laboratories are presented in Table 1.

NOTES ON WORK COMPLETED

#10; #4

COORD. MTG SAW ~~&~~ HE'S WITH ESN ; GOT JFK ORIENTED ON 6 CUTS

SET-UP ON DP37 → SEE BORING LOG; TOOK PHOTO; USED SIEVES (#1 ~~#4~~) TAKE WEIGHT OF GRAVEL

SET-UP ON DP33 @ 0830 → TOOK PHOTO; STARTED COLLECTING SIDE-BY SIDE SOILS FOR SAMPLE VOLUME

SET-UP ON DP40 @ 1030

SET-UP ON DP36 @ 1140 → TOOK PHOTO

SET-UP ON DP38 @ 1240 → ~~TOOK PHOTO~~

GRAVELLY FILL IS ~~MAKING~~ HAMPERING RECOVERIES AND SAMPLE VOLUMES ~~MAKE ESTIMATES~~

ALSO DIFFICULT TO DISTINGUISH BETWEEN GRAY TO BROWN GRAVELLY SAND FILL AND SANDY GRAVEL FILL (LUMP TOGETHER?), ONLY CLEAR DISTINCTION IS DARKER, CLEANER SAND/GRAVEL

DP30 @ 1345 → TOOK PHOTO

DP27 @ 1430 → PHOTO → DIDN'T NEED ~~2nd~~ boring due to grain size & recovery

DP34 @ 1515 → COULDN'T DO 2nd boring due to concrete

ADVANCED ALL BORINGS AS PLANNED

ADDED ONE EXTRA ~~ANALYSIS~~ SAMPLE FOR ANALYSIS
↳ DP33 7-8 SW/GP ONLY LOCATION W/ DARK SAND FILL

IN SUMMARY, NO OBVIOUS VISUAL, ODOR, SHEEN, OR PID EVIDENCE OF IMPACT IN ANY BORINGS

TWO SIDE BY SIDE SOILS COLLECTED FROM ALL BORINGS (EXCEPT DP32 and DP34 (1st) (last))

MOST OF SHANNON ENCOUNTERED FILL WAS MUCH MORE GRAVELLY THAN DESCRIBED BY GEOLOGISTS

This page has been left blank intentionally to allow for double-sided printing.

PIONEER TECHNOLOGIES CORPORATION (PTC)
FIELD CHECKLIST

Project/Task Name: Port of Olympia East Bay Data Gap Site Location: East Bay

Requested By / Date: TDB 09/12/11 Work Scheduled: TBD

SERVICES REQUESTED	COMPLETED
1) Conduct H&S tailgate meeting & complete form	☐ YES ☐ NO
2) Advance and log soil borings DP46 to DP56 (see Table 1, Figure 1, Figure 2)	☐ YES ☐ NO
3) Containerize and select intervals for analysis per Table 1	☐ YES ☐ NO
4) Attempt to remove P-1 anomaly (see Table 1 and Figure 1) if it can be done safely and without damaging infrastructure	☐ YES ☐ NO
5) If removed, haul P-1 anomaly and any associated impacted soil to Weyerhaeuser Regional Landfill for disposal	☐ YES ☐ NO
6) If removed, collect confirmation soil samples from P-1 anomaly excavation (see Table 1)	☐ YES ☐ NO
7) GPS locate all sample locations	☐ YES ☐ NO
8) Take representative photos	☐ YES ☐ NO
9) Communicate target reporting limit expectations to labs	☐ YES ☐ NO
Jack Merrigan 360-259-3577 Bill Helbig 528-8022	☐ YES ☐ NO
	☐ YES ☐ NO
	☐ YES ☐ NO

ADDITIONAL STANDARD INSTRUCTIONS	COMPLETED		COMPLETED
☒ Review Docs: Data Gap WP; PTC HASP	☐ YES ☐ NO	☒ Health & Safety Meeting	☐ YES ☐ NO
☒ Agency NOI / Utility Locate / Concrete Coring	☐ YES ☐ NO	☒ Call PM from Site	☐ YES ☐ NO
☒ Coordinate Access: Port (Alex or Bill Helbig)	☐ YES ☐ NO	☐ Draw Site Map _____	☐ YES ☐ NO
☒ Coordinate Subs: ESN, excavation, disposal	☐ YES ☐ NO	☒ Cuttings / Purge Water Characterization & Disposal	
☐ Purchase / Rent Equip: _____	☐ YES ☐ NO	☐ Potential HW _____	☐ YES ☐ NO
☒ Client/Agency Coordination: Port, City, & Ecology	☐ YES ☐ NO	☐ Non-Haz _____	☐ YES ☐ NO
☐ Calibrate Equipment: _____	☐ YES ☐ NO	☐ Background _____	☐ YES ☐ NO

Discuss concrete coring/repair options/requirements with ESN, Port, and City. Have ESN handle Ecology NOI. Utility locate: (1) Call Before U Dig: 800-553-4344 and (2) coordinate new utilities with Port (Bill Helbig 528-8022) and City. Have Port (and City?) on-site for P-1 anomaly excavation attempt. See Table 2 for IDW handling.

SAMPLING REQUIREMENTS

☐ Field Testing: _____

☒ Lab Testing: PAHs by 8270, TPH-D and TPH-HO by NWTPH-Dx, PCBs by 8082 Laboratory: Anatek - Moscow

☒ Lab Testing: Dioxins/furans by 8290 Laboratory: PACE-Minneapolis

☐ Lab Testing: _____ Laboratory: _____

FIELD SUPPLIES NEEDED

NOTES ON WORK COMPLETED

2/9/2012 8:00 Set up around excavation
9.00 began excavation, quickly found P-1 anomoly it was attached to and surrounded by large chunks of concrete There was a noticable sheen on soil and ground water. Ground water was encountered at 3' bgs. After concrete was broken up the anomoly was remeved do not know what it is.
Because of sheen decided to dispose of Stockpile.
10:45 sampled Stockpile 5 point compos.ite
12:00 pumped the water out, ~~the~~ scooped the bottom and cleaned up sides. Pumped water again and took the following samples:

@ 1400 P-1-W_02092012_2.5
1415 P-1-S_02092012_3
1430 P-1-E_02092012_2.5
1445 P-1_N_02092012_3
1500 P-1-B_02092012_7

Bottom sample was taken after pumping and scooping some scoops into the stockpile then sampling.
Ken Butti said that no water sampling needed just add absorbent pads to water then discharge. 4:00 left site after securing hole
2/10/12 Returned to site after night of heavy rain to hole filled with water with product on top. Used absorbant pads & pumped & filled alternately. Pumped all water & filled hole. (see photos for material)

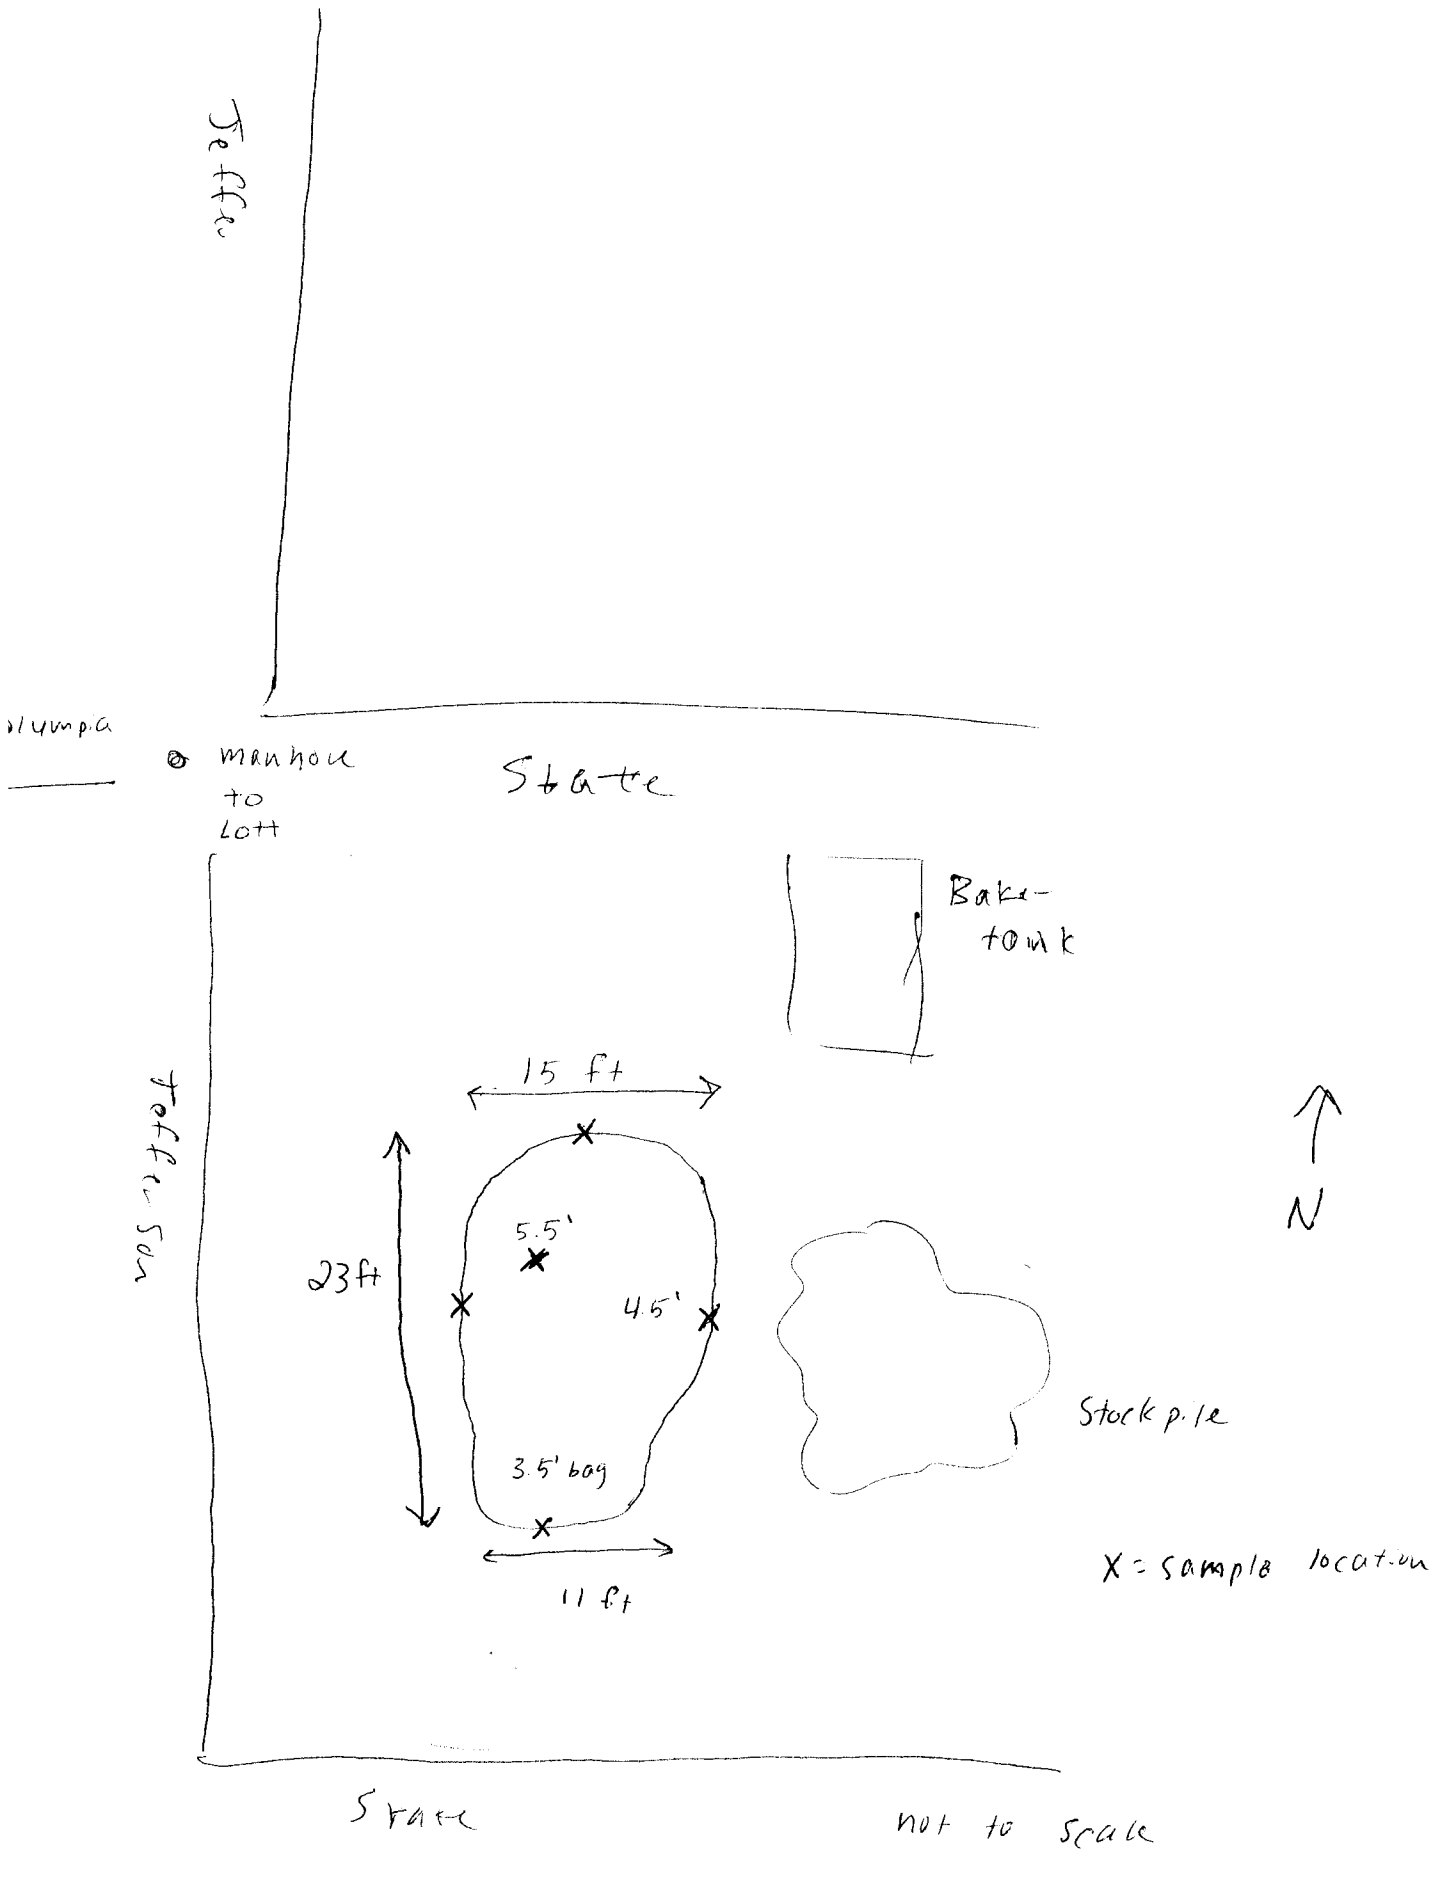
NOTES ON WORK COMPLETED

2/16 After several days of allowing absorbant pads to soak up the sheen on top of the water being stored in the baker tank, water was discharged to LOTT from a man hole in the sidewalk ~~where~~ at the intersection of Olympia Avenue and Jefferson. One load of the stockpile was hauled to the Weyerhauser landfill in Longview.



2/17 Remaining stockpile and anomaly were hauled off-site

2/20 all ~~water~~ remaining water was discharged

2/21 ~~Tank out~~ Baker tank used to store water was cleaned

See sketch of excavation on back

This page has been left blank intentionally to allow for double-sided printing.

PIONEER TECHNOLOGIES CORPORATION (PIONEER)
FIELD CHECKLIST

Project/Task Name: East Bay POC GWM Event
Site Location: East Bay, Olympia
Requested By / Date: TDB / 9/17/14
Work Scheduled: 9/29/14 (& 9/30 if necessary)

SERVICES REQUESTED	COMPLETED
1. Office/field prep tasks: (a) ensure all applicable pre-mob HASP forms are completed, (b) gather tide info, (c) conduct tailgate & document, (d) communicate decon & site control expectations, (e) implement traffic control plan	☒ YES ☐ NO
2. Water levels & LNAPL measurements from 16 MWs listed in WP as synoptically as possible	☒ YES ☐ NO
3. Low-flow purge & sample from MW12, MW18, MW26, and MW27 as close to low tide as possible	☒ YES ☐ NO
4. Field QC = 1 field dup	☒ YES ☐ NO
5. Save dedicated GWM tubing in dedicated bags for future GWM events	☒ YES ☐ NO
6. Waste Mgmt: (a) Use 16-gal drum(s), (b) label drum(s), (c) store in secure location, (d) ensure Port has containment for liquid drums, (e) collect sample for LOTT characterization (see below)	☒ YES ☐ NO
7. Complete daily field notes, and note any deviations from Work Plan	☒ YES ☐ NO
8. Use PIONEER Sample ID nomenclature for all samples per Work Plan	☒ YES ☐ NO
9. After shipping samples, reiterate to lab re: (a) NWTPH-HCID before NWTPH-Dx, (b) silica gel prep for NWTPH-Dx, (c) lab doing filtering for dissolved arsenic, (d) target RLs, (e) PIONEER EDD expectations	☐ YES ☐ NO
	☐ YES ☐ NO
	☐ YES ☐ NO

NOTES ON WORK COMPLETED

Correction: MW09 is MW with bent casing

10:00 Safety Tailgate
10:30 Begin opening mws.
-Note: Purchase extra bolts
1:00 Begin checking H_2O levels w/ interface probes
-Note: MW08 PVC pipe bent cannot check levels
-Note: MW02R decommissioned by LOTT.
-Note: MW24S decommissioned by PIONEER.

2:35 Begin pumping MW-12 ; low tide @ 3:46 PM - 6.2ft
-water level = 8.5 ft bgs
- water is brown, murky No odor or sheen
2:55 GW-MW-12-092914

3:30 Begin pumping MW-26
-water is light grey colour, ~~stne~~ strong sea water odor
-water level = 10 ft within 15 min of low tide (6.4 ft)
3:50 GW-MW-26-092914
3:55 GW-MW-26-092914-(01) - field duplicate

4:25 Begin pumping MW-27
-water clear, no sheen
5:00 GW-MW-27-092914

5:25 measured water level at MW-18. No water 1.5 hours after low tide.

5:50 WW-EB-1-092914, Purge water from drums

6:10 Checked MW-18 water levels. Under 0.5 feet and mud on indicator. Will try morning of 9/30/2014

Analytical Laboratory Reports Not Included in Other Appendices

This page has been left blank intentionally to allow for double-sided printing.

Table of Contents

1. Pre-AO Soil Sampling
2. Phase I RI Soil Sampling
3. Phase 2 RI Soil Sampling
4. Parcel 4/5 Pre-IA Soil Sampling
5. Data Gap Investigation Regarding the Site Boundary Determination and P-1 Anomaly
6. Data Gap Investigation Regarding the Soil-to-Indoor Air Pathway
7. Data Gap Investigation Regarding POC GWM (September 2014 Drilling/Soil Sampling)
8. Data Gap Investigation Regarding POC GWM (September 2014 GWM)
9. Data Gap Investigation Regarding POC GWM (December 2014 GWM Event and February Re-sample of MW12)
10. Data Gap Investigation Regarding POC GWM (March 2015 GWM Event)
11. Data Gap Investigation Regarding POC GWM (June 2015 GWM Event)

This page has been left blank intentionally to allow for double-sided printing.

PRE-AO SOIL SAMPLING

This page has been left blank intentionally to allow for double-sided printing.

ANALYTICAL REPORT

Job Number: 580-3718-1

Job Description: Rants Group

For:
GeoEngineers Inc
1101 Fawcett, Suite 200
Tacoma, WA 98402

Attention: Kevin M Broom

Heather Curbow
Project Mgmt. Assistant
hcurbow@stl-inc.com
10/23/2006
Revision: 1

Project Manager: Heather Curbow

STL Seattle is a part of Severn Trent Laboratories, Inc.

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender immediately at 253-922-2310 and destroy this report immediately.

Case Narrative for job: 580-J3718-1

Client: GeoEngineers Inc
Date: 10/23/2006

SEMIVOLATILE 8270C SIM cPAH-solid
The recovery of the surrogate Terphenyl-d14 in sample 580-3718-11 exceeded quality control limits. All other surrogates were within control limits. No further action was taken on this outlier.

[redacted]
The recovery of the surrogate DCB Decachlorobiphenyl in samples 580-3718-7 and 580-3718-3 exceeded quality control limits. All other surrogates were within control limits. No further action was taken on this outlier.

[redacted]
Recovery of the surrogate DCB Decachlorobiphenyl in sample 580-3718-4 and both Tetrachloro-m-xylene and DCB Decachlorobiphenyl in sample 580-3718-1 exceeded quality control limits due to matrix interference.

Semivolatile GC

LCS recoveries out of control

NWTPH-Dx
LCS for motor oil failed high. LCSD for motor oil was acceptable

Affected Items
LCS 580-11251/2-B

Batch: 580-11354
Method: 580-NWTPH_Dx

Volatile Organics

LCS recoveries out of control

5035_FM/8260B:
Chloroethane recovery supressed by the increased amount of methanol in med. soil prep. Trichlorofluoromethane passed in lcs and failed low in lcsd. 2-2-dichloropropane failed high in the lcsd - samples ND.

Affected Items
LCS 580-11480/2-A

Batch: 580-11569
Method: 580-8260B

LCSD 580-11480/3-A

Batch: 580-11569
Method: 580-8260B

DATA REPORTING QUALIFIERS

Client: GeoEngineers Inc Job Number: 580-3718-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	B	Compound was found in the blank and sample.
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate exceeds the control limits
GC VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	*	LCS or LCSD exceeds the control limits
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate exceeds the control limits
	D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
Metals		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-3718-1

Login Number: 3718

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	

ANALYTICAL REPORT

LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-3718-2

Login Number: 3718

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	

ANALYTICAL REPORT

Job Number: 580-4641-1

Job Description: Port of Olympia – HOCM: 0615-033-00

For:
GeoEngineers Inc
1101 Fawcett, Suite 200
Tacoma, WA 98402

Attention: Kevin M Broom

Heather Curbow
Project Manager I
hcurbow@stl-inc.com
01/23/2007

Project Manager: Heather Curbow

STL Seattle is a part of Severn Trent Laboratories, Inc.

If you have received this report in error, please notify the sender immediately at 253-922-2310 and destroy this report immediately.

Case Narrative for job: 580-J4641-1

Client: GeoEngineers Inc
Date: 01/23/2007

5035/8260B:
Several analytes were outside QC limits in either the LCS and or LCSD. The individual response of each analyte is influenced by the increased methanol (necessary to obtain requied RL of soil extracts) as indicated by acceptable recoveries in the water LCS/LCSD which is prepared identcally, less the methanol. Minimal outliers are expected in full volatile list analyses. No further action taken.

The relative percent difference (RPD) for Dichlorobromomethane between the LCS and the LCSD associated with batch 580-14661 exceeded the QC acceptance limits. The recovery of this compound in both the LCS and LCSD was within quality control limits. No further action was taken on this outlier.

[redacted]
The recovery of several analytes exceeded quality control limits in the LCS and LCSD. Minimal outliers are expected in full volatile list analyses. The method blank and surrogate recoveries were within control limits. No further action was taken on this outlier.

DATA REPORTING QUALIFIERS

Client: GeoEngineers Inc Job Number: 580-4641-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	*	RPD of the LCS and LCSD exceeds the control limits
GC/MS Semi VOA		
	*	LCS or LCSD exceeds the control limits
GC VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-4641-1

Login Number: 4641

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	NA	lab driver brought to SR
Cooler Temperature is acceptable.	NA	
Cooler Temperature is recorded.	NA	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	NA	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	

ANALYTICAL REPORT

Job Number: 580-4730-1

Job Description: Port of Olympia city hall 0415-052-03

For:
GeoEngineers Inc
1101 Fawcett, Suite 200
Tacoma, WA 98402

Attention: Kevin M Broom

Heather Curbow
Project Manager I
hcurbow@stl-inc.com
01/30/2007

Project Manager: Heather Curbow

STL Seattle is a part of Severn Trent Laboratories, Inc.

8260 Volatiles

The relative percent difference (RPD) for Trichlorofluoromethane between the LCS and the LCSD associated with batch Analysis Batch: 580-14881 exceeded the QC acceptance limits. The recovery of this compound in both the LCS and LCSD was within quality control limits. No further action was taken on this outlier.

Semivolatile GC-MS

LCS/LCSD - %R High

8270
The LCS/LCSD failed high for the following analytes. 4-nitroaniline, 3,3'-dichlorobenzidine, and 2-methylphenol. There were no hits in the samples.
3-nitroaniline and carbozole had valid calibrations up to 500 ug/L solution concentration. The LCS/LCSD were spiked at 500 ug/L. The results for the LCS/LCSD were acceptable, but exceeded the calibration range. The LCS/LCSD results for these targets will be marked as E. There were no hits of these target analytes in the samples, except sample 5 had a hit of carbozole, but it was with in the calibration range

Affected Items

LCSD 580-14867/3-AA
Batch: 580-15054
Method: 580-8270C

LCS 580-14867/2-AA
Batch: 580-15054
Method: 580-8270C

Volatile Organics

Method Blank Contamination

5035_FM/8260B:
The bromomethane hit in the MB was between the mdl and half the rl - no further action taken.

Affected Items

MB 580-14844/1-AA
Batch: 580-14881
Method: 580-8260B

Volatile Organics

LCS recoveries out of control

5035_FM/8260B:
Chloroethane recovery failed low in the lcs/lcsd, trichlorofluoromethane recovery failed low in the lcsd - these failures due to the increased volume of methanol used in prep.

Chlorobromomethane failed high in the lcsd but passed in the lcs - sample ND for it.

Affected Items

LCS 580-14844/2-AA
Batch: 580-14881
Method: 580-8260B

LCSD 580-14844/3-AA
Batch: 580-14881
Method: 580-8260B

DATA REPORTING QUALIFIERS

Client: GeoEngineers Inc Job Number: 580-4730-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	*	RPD of the LCS and LCSD exceeds the control limits
GC/MS Semi VOA		
	*	LCS or LCSD exceeds the control limits
	F	MS or MSD exceeds the control limits
	E	Result exceeded calibration range, secondary dilution required.
	F	RPD of the MS and MSD exceeds the control limits
	X	Surrogate exceeds the control limits
GC Semi VOA		
	X	Surrogate exceeds the control limits
	D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.

LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-4730-1

Login Number: 4730

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	

ANALYTICAL REPORT

Job Number: 580-4758-1

Job Description: Port of Olympia city hall 0415-052-03

For:
GeoEngineers Inc
1101 Fawcett, Suite 200
Tacoma, WA 98402

Attention: Kevin M Broom

Heather Curbow
Project Manager I
hcurbow@stl-inc.com
01/30/2007

Project Manager: Heather Curbow

STL Seattle is a part of Severn Trent Laboratories, Inc.

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. Semivolatile GC

Surrogate - Matrix

Surrogate recovery for sample 4758-3 was outside control limits. This sample shows evidence of matrix interference; therefore, re-extraction and/or re-analysis was not performed.

Affected Items

580-4758-A-3-D

Batch: 580-14985
Method: 580-NWTPH_Dx

Volatile Organics

Other Anomaly

5035/8260B: Chloromethane, Methylene chloride, Styrene, and 1,2,4-trimethylbenzene were detected in the MB above the MDL but below 1/2 the RL. No further action taken.

Affected Items

MB 580-15000/1-AA

Batch: 580-15012
Method: 580-8260B

Volatile Organics

Other Anomaly

5035/8260B: Bromchloromethane exceeds upper recovery QC limit in the LCS/LCSD. RPD within advisory limits and all associated samples ND. Chloroethane recovery low in LCS/LCSD due to additional methanol required to achieve requested RL. Interference is indicated by acceptable recovey in water LCS which is prepared in the same mannor as the soil LCS/LCSD less the additional methanol. No further action taken.

Affected Items

LCS 580-15000/2-AA

Batch: 580-15012
Method: 580-8260B

LCSD 580-15000/3-AA

Batch: 580-15012
Method: 580-8260B

DATA REPORTING QUALIFIERS

Client: GeoEngineers Inc Job Number: 580-4758-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	*	RPD of the LCS and LCSD exceeds the control limits
GC/MS Semi VOA		
	*	RPD of the LCS and LCSD exceeds the control limits
GC Semi VOA		
	X	Surrogate exceeds the control limits

LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-4758-1

Login Number: 4758

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

BROWN AND CALDWELL

March 15, 2007

Mr. Rick Hughes
General Counsel
LOTT Alliance
111 Market Street NW, Suite 250
Olympia, WA 98501

131358

Subject: Environmental Investigation
Port of Olympia East Bay Property
316 Jefferson Street
Olympia, WA

Dear Mr. Hughes:

This letter report documents Brown and Caldwell's observations and field activities associated with subsurface investigations conducted at the Port of Olympia East Bay Property (the Site) on February 14, 2007. This investigation was conducted to supplement the findings of the initial Phase II Environmental Site Assessment (ESA) of the Site (Brown and Caldwell, 2007).

Scope of Work

The field activities conducted on February 14, 2007 included soil and groundwater sampling. Sampling locations from the February 14, 2007 field work, as well as sampling locations from the previous field work for the Phase II ESA, are shown on Figure 2.

The soil and groundwater investigation was conducted using truck-mounted direct push sampling equipment. The sampling equipment was driven to first contact with groundwater, and composite samples from the deepest five feet of soil were taken. One groundwater sample was collected from each location using disposable polyethylene tubing inserted into the interior of the drill rod and a peristaltic pump to extract groundwater. A field duplicate soil sample and a field duplicate groundwater sample, labeled "duplicate" were collected from one of the sample locations.

Samples were submitted for analysis for diesel-range petroleum hydrocarbons by NWTPH-Dx, for arsenic, barium, chromium, cadmium, lead, selenium, and silver by EPA Method 6020, mercury by EPA Method 7471A. Analysis was performed by TestAmerica, Inc., Bothell, WA.

No deviations from scope occurred during the field work.

ACCREDITED IN ACCORDANCE WITH nelac

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method 8260B: 5035/8260B

The target compound Methylene Chloride was detected in the method blank at a concentration above the MDL but less than one half the reporting limit. The anomaly was flagged on the appropriate forms and all associated detections of Methylene Chloride in the samples were B flagged. No further corrective action was performed.

The 22% RPD for the compound Tetrachlorethene exceeded the QC limit of 20% between the LCS and LCSD analyses. Since both of the individual recoveries were within QC control limits, the anomaly was flagged on the appropriate form, and no further corrective action was performed.

The recoveries of the spiking compounds Chloroethane; Dichlorobromomethane; cis-1,3-Dichloropropene; trans-1,3-Dichloropropene; Chlorodibromomethane; 1,1,1,2-Tetrachloroethane; and Bromoform fell below the QC recovery ranges in the LCS and LCSD. Since a water LCS (data file: VB 0008213), which was prepared using the same spiking solutions, was in control for all listed compounds, the anomalies were attributed to the increased amount of methanol in the sparged volume of methanolic extracts. The anomalies were flagged on the appropriate forms, and no further corrective action was performed.

The recovery of Carbon Tetrachloride; Ethylene Dibromide; and 1,2-Dibromo-3-Chloropropane fell below QC limits in the LCSD. The LCS recovery for these analytes was within QC control limits. Also, the RPD for the compound 1,2-Dibromo-3-Chloropropane was affected by the LCSD outlier. no further action was taken.

No other analytical or quality issues were noted.

GC/MS Semi VOA
Method 8270C: The laboratory control standard (LCS) for preparation batch 21475 exceeded control limits for the following analytesDi-n-butylphthalate. Total does not exceed max. allowable(3).

No other analytical or quality issues were noted.

GC Semi VOA
Method NWTPH-Dx: NWDX
The %R failed high for the LCS and LCSD in the motor oil range. It appears the LCS and LCSD concentrated during the silica gel clean up. The LCS and LCSD were re-silica gel'ed with acceptable results for the motor oil range. The samples were examined for similar concentration but non of the samples had failing high surrogetes. The re-run results for the motor oil range were marked as primary.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

DATA REPORTING QUALIFIERS

Client: GeoEngineers Inc Job Number: 580-6773-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	*	RPD of the LCS and LCSD exceeds the control limits
GC/MS Semi VOA		
	*	LCS or LCSD exceeds the control limits
	F	MS or MSD exceeds the control limits
	*	RPD of the LCS and LCSD exceeds the control limits
	F	RPD of the MS and MSD exceeds the control limits
	X	Surrogate exceeds the control limits
GC Semi VOA		
	*	LCS or LCSD exceeds the control limits
	*	RPD of the LCS and LCSD exceeds the control limits
	F	RPD of the MS and MSD exceeds the control limits
Metals		
	F	MS or MSD exceeds the control limits

LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-6773-1

Login Number: 6773

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

ACCREDITED IN ACCORDANCE WITH nelac

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method 8260B: 5035/8260B

The target compound Methylene Chloride was detected in the method blank at a concentration above the MDL but less than one half the reporting limit. The anomaly was flagged on the appropriate forms and all associated detections of Methylene Chloride in the samples were B flagged. No further corrective action was performed.

The 22% RPD for the compound Tetrachlorethene exceeded the QC limit of 20% between the LCS and LCSD analyses. Since both of the individual recoveries were within QC control limits, the anomaly was flagged on the appropriate form, and no further corrective action was performed.

The recoveries of the spiking compounds Chloroethane; Dichlorobromomethane; cis-1,3-Dichloropropene; trans-1,3-Dichloropropene; Chlorodibromomethane; 1,1,1,2-Tetrachloroethane; and Bromoform fell below the QC recovery ranges in the LCS and LCSD. In addition, the recovery of Carbon Tetrachloride; Ethylene Dibromide; and 1,2-Dibromo-3-Chloropropane fell below QC limits in the LCSD. Since a water LCS (data file: VB 0008213), which was prepared using the same spiking solutions, was in control for all listed compounds, the anomalies were attributed to the increased amount of methanol in the sparged volume of methanolic extracts. The anomalies were flagged on the appropriate forms, and no further corrective action was performed.

No other analytical or quality issues were noted.

GC/MS Semi VOA
Method 8270C: The laboratory control standard (LCS) for preparation batch 21475 exceeded control limits for the following analytesDi-n-butylphthalate. Total does not exceed max. allowable(3).

The recovery of the surrogate Terphenyl-d14 exceeded quality control limits in samples 580-6774-8 and 18. The recovery of the surrogate Phenol-d5 exceeded quality control limits in sample 580-6774-10. All other surrogates were within control limits. No further action was taken on this outlier.

No other analytical or quality issues were noted.

GC Semi VOA
Method NWTPH-Dx: NWDX
The %R failed high for the LCS and LCSD in the motor oil range. It appears the LCS and LCSD concentrated during the silica gel clean up. The LCS and LCSD were re-silica gel'ed with acceptable results for the motor oil range. The samples were examined for similar concentration but non of the samples had failing high surrogetes. The re-run results for the motor oil range were marked as primary.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

8082 Polychlorinated Biphenyls (PCBs) by Gas Chromatography

Method: 8082 | Analysis Batch: 580-21776 | Instrument ID: SEA034
Preparation: 3550B | Prep Batch: 580-21510 | Lab File ID: PCB9931.D
Dilution: 5.0 | Initial Weight/Volume: 10.2849 g
Date Analyzed: 08/09/2007 0820 | Final Weight/Volume: 20 mL
Date Prepared: 08/08/2007 0956 | Injection Volume:
Column ID: PRIMARY

Analyte	DryWt Corrected: Y	Result (mg/Kg)	Qualifier	RL	RL
PCB-1016		ND		0.12	0.12
PCB-1221		ND		0.12	0.12
PCB-1232		ND		0.12	0.12
PCB-1242		ND		0.12	0.12
PCB-1248		ND		0.12	0.12
PCB-1254		ND		0.12	0.12
PCB-1260		ND	*	0.12	0.12

Surrogate	%Rec	Acceptance Limits
Tetrachloro-m-xylene	75	45 - 155
DCB Decachlorobiphenyl	83	50 - 150

Client: GeoEngineers Inc

Job Number: 580-6774-1

Client Sample ID: MW20-080207-060

Lab Sample ID: 580-6774-10
Client Matrix: Solid
% Moisture: 70.1
Date Sampled: 08/02/2007 1310
Date Received: 08/03/2007 0950

8082 Polychlorinated Biphenyls (PCBs) by Gas Chromatography

Method: 8082
Preparation: 3550B
Dilution: 5.0
Date Analyzed: 08/09/2007 0844
Date Prepared: 08/08/2007 0956
Analysis Batch: 580-21776
Prep Batch: 580-21510
Instrument ID: SEA034
Lab File ID: PCB9932.D
Initial Weight/Volume: 10.2353 g
Final Weight/Volume: 20 mL
Injection Volume:
