LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-6774-1

Login Number: 6774

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Login Number: 6774
List Source: TestAmerica Tacoma
Creator: Moon, Joseph
List Number: 1

Question	T / F/ NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

ACCREDITED IN ACCORDANCE WITH nelac

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method 8260B: 5035/8260B

The recoveries of the spiking compounds Chloroethane; Dichlorobromomethane; cis-1,3-Dichloropropene; trans-1,3-Dichloropropene; Chlorodibromomethane; 1,1,1,2-Tetrachloroethane; Bromoform; and 1,2-Dibromo-3-Chloropropane fell below the QC recovery range in the LCS and LCSD. In addition, the compounds Carbon Tetrachloride and Ethylene Dibromide fell below QC recovery range in the LCS. Since a water LCS (data file: VB0008345), which was prepared using the same spiking solutions, was found to be within control limits for all listed compounds except for 1,1,1,2-Tetrachloroethane, which met ME criteria, the anomalies were attributed to the increased amount of methanol in the sparged volume of methanolic extracts. The anomalies were flagged on the appropriate forms. No further corrective action was performed.

No other analytical or quality issues were noted.

GC/MS Semi VOA
The recovery of the surrogate 2-Fluorobiphenyl in sample 580-6792-8 and 2-Fluorophenol in sample 580-6792-35 exceeded quality control limits. All other surrogates were within control limits. No further action was taken on this outlier.

No other analytical or quality issues were noted.

GC Semi VOA
Method 8082: Surrogate recovery for the following sample(s) was outside the upper control limit: 27 and 35. These samples did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed. Noted possible double surrogate.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

DATA REPORTING QUALIFIERS

Client: GeoEngineers Inc Job Number: 580-6792-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD exceeds the control limits
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	F	RPD of the MS and MSD exceeds the control limits
GC/MS Semi VOA		
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate exceeds the control limits
GC Semi VOA		
	*	RPD of the LCS and LCSD exceeds the control limits
	F	RPD of the MS and MSD exceeds the control limits
	X	Surrogate exceeds the control limits

LOGIN SAMPLE RECEIPT CHECK LIST

Client: GeoEngineers Inc

Job Number: 580-6792-1

Login Number: 6792

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	NA	
The cooler or samples do not appear to have been compromised or tampered with.	NA	
Samples were received on ice.	NA	
Cooler Temperature is acceptable.	NA	
Cooler Temperature is recorded.	NA	
COC is present.	NA	
COC is filled out in ink and legible.	NA	
COC is filled out with all pertinent information.	NA	
There are no discrepancies between the sample IDs on the containers and the COC.	NA	
Samples are received within Holding Time.	NA	
Sample containers have legible labels.	NA	
Containers are not broken or leaking.	NA	
Sample collection date/times are provided.	NA	
Appropriate sample containers are used.	NA	
Sample bottles are completely filled.	NA	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	NA	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	NA	
If necessary, staff have been informed of any short hold time or quick TAT needs	NA	
Multiphasic samples are not present.	NA	
Samples do not require splitting or compositing.	NA	

ANALYTICAL REPORT

Job Number: 580-6792-2

Job Description: 0615-034-02

For:
GeoEngineers Inc
1101 Fawcett, Suite 200
Tacoma, WA 98402

Attention: Kevin M Broom

Heather Curbow
Project Manager I

Comments
NWTPH-Gx followup analysis requested by client.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method NWTPH-Gx: The method blank has a hit above the MDL but below half the reporting limit. The result was J flagged on all the appropriate forms. No further corrective action taken.

No other analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Heather Curbow
TestAmerica Tacoma
5755 8th Street East
Tacoma, WA 98424

Dear Ms. Curbow,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on October 10, 2007. These samples are associated with your 580-7686 project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4362.

Sincerely,

for
Linda Laver
Project Manager

Case Narrative

TestAmerica West Sacramento Project Number G7J100332

SOLID, 8290, Dioxins/Furans
Sample(s): 1, 2, 3, 4, 5
Please note that the result for 2, 3, 7, 8-TCDF is reported from the confirmation analysis that occurred on October 22, 2007.

Sample(s): 1, 2
The concentration of OCDD in G7J100332-1, -2 and the concentration of 1,2,3,4,6,7,8-HpCDD in sample G7J100332-1 have exceeded the upper quantitation level of the initial calibration curve, but the peaks did not saturate the instrument detector. Historical data indicates that for the isotope dilution method, dilution and re-analysis will not produce significantly different results from those reported with the 'E" qualifier.

Sample(s): 4, 5
The internal standard recovery of 13C-OCDD is above the method recommended goal of 135% in the samples. The high recoveries can be attributed to the high native concentration of OCDD.

SOLID, 9060M, TOC, Single analysis
Sample(s): 2
The sample measurement times were manually extended for several replicates during Total Organic Carbon analysis for the associated samples. The software had stopped the integration period prematurely as a result of a slower than normal combustion.

Sample(s): 5
The sample was reanalyzed after the holding time had expired. The sample was initially analyzed within holding time on October 29, 2007, with a Total Organic Carbon result of 34,700 mg/kg. However, the client requested one sample from this lot to be analyzed in triplicate, which was not done. The reanalysis was performed after the 28 day holding time had expired on November 2, 2007, and yielded a triplicate average TOC result of 32,700 mg/kg. The reanalysis on November 2, 2007 was reported.

There were no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight

Question	T / F/ NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

TestAmerica Tacoma is a part of TestAmerica Laboratories, Inc.

This report is issued solely for the use of the person or company to whom it is addressed. Any use, copying or disclosure other than by the intended recipient is unauthorized. If you have received this report in error, please notify the sender immediately at 253-922-2310 and destroy this report immediately.

This report shall not be reproduced except in full, without prior express written approval by the laboratory. The results relate only to the item(s) tested and the sample(s) as received by the laboratory.

The results included in this report have been reviewed for compliance with the laboratory QA/QC plan and meet all requirements of NELAC. All data have been found to be compliant with laboratory protocol, with the exception of any items noted in the case narrative.

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method(s) 5035: Due to percent moisture values greater than 10%, the final volumes for all associated samples were corrected for the solvent/water dilution effect.

Corrected FV = ((g of samples * % moisture/100) + ml of MeOH) * 40 (dilution factor)

No analytical or quality issues were noted.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Subcontract Sister
Samples were sent to Sister lab Sacramento for Dioxin analysis. The results are included here in this report.

Organic Prep
No analytical or quality issues were noted.

DATA REPORTING QUALIFIERS

Client: Brown and Caldwell

Job Number: 580-11548-1
Sdg Number: Lott Admin Phase II

Lab Section	Qualifier	Description
GC/MS VOA		
	I	Indicates the presence of an interference, recovery is not calculated.
	X	Surrogate exceeds the control limits
GC/MS Semi VOA		
	F	MS or MSD exceeds the control limits
	F	RPD of the MS and MSD exceeds the control limits
GC Semi VOA		
	F	Duplicate RPD exceeds the control limit
	I	Indicates the presence of an interference, recovery is not calculated.
	X	Surrogate exceeds the control limits
	D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
Metals		
	F	Duplicate RPD exceeds the control limit

Heather Curbow
TestAmerica Tacoma
5755 8th Street East
Tacoma, WA 98424

Dear Ms. Curbow,

This report contains the analytical results for the samples received under chain of custody by TestAmerica on October 11, 2008. These samples are associated with your 580-11548 project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4402.

Sincerely,

Jill Kellmann
Project Manager

Laura Nelson
Project Administrator

Case Narrative

TestAmerica West Sacramento Project Number G8J130196

SOLID, 1613B, Dioxins/Furans
Samples: 1, 2, 4, 8, 11, 12, 14, 15, 16, 23
The above samples required DB-225 Confirmation (CON) analysis for 2,3,7,8-TCDF, which were performed October 27 and 28, 2008.

Sample: 2
Sample 2 was diluted 5X due to matrix interference. All internal standards are within control and meet signal to noise criteria. Detection limits have been adjusted accordingly.

There are no other anomalies associated with this project.

QC Parameter Definitions

QC Batch: The QC batch consists of a set of up to 20 field samples that behave similarly (i.e., same matrix) and are processed using the same procedures, reagents, and standards at the same time.

Method Blank: An analytical control consisting of all reagents, which may include internal standards and surrogates, and is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background contamination.

Laboratory Control Sample and Laboratory Control Sample Duplicate (LCS/LCSD): An aliquot of blank matrix spiked with known amounts of representative target analytes. The LCS (and LCSD as required) is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects. If an LCSD is performed, it may also be used to evaluate the precision of the process.

Duplicate Sample (DU): Different aliquots of the same sample are analyzed to evaluate the precision of an analysis.

Surrogates: Organic compounds not expected to be detected in field samples, which behave similarly to target analytes. These are added to every sample within a batch at a known concentration to determine the efficiency of the sample preparation and analytical process.

Matrix Spike and Matrix Spike Duplicate (MS/MSD): An MS is an aliquot of a matrix fortified with known quantities of specific compounds and subjected to an entire analytical procedure in order to indicate the appropriateness of the method for a particular matrix. The percent recovery for the respective compound(s) is then calculated. The MSD is a second aliquot of the same matrix as the matrix spike, also spiked, in order to determine the precision of the method.

Isotope Dilution: For isotope dilution methods, isotopically labeled analogs (internal standards) of the native target analytes are spiked into the sample at time of extraction. These internal standards are used for quantitation, and monitor and correct for matrix effects. Since matrix effects on method performance can be judged by the recovery of these analogs, there is little added benefit of performing MS/MSD for these methods. MS/MSD are only performed for client or QAPP requirements.

Control Limits: The reported control limits are either based on laboratory historical data, method requirements, or project data quality objectives. The control limits represent the estimated uncertainty of the test results.

Sample Summary

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as “ND” were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Question	T / F/ NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	N/A	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

PHASE I RI SOIL SAMPLING

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review and Verification
East Bay Phase 1 RI – November 2008

1. Precision
Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, all matrix spike duplicate RPDs were within the acceptable range, with one exception. The RPD for 1,2,3,4,6,7,8,9-octachloro dibenzo-p-dioxin in one matrix spike duplicate was low due to variable background-subtracted results in the two matrix spikes as discussed in the Pace Analytical Services case narrative. Further data qualification beyond what was reported by the laboratories was not necessary. It should be noted that the QAPP (GeoEngineers, 2008) did not specify expectations for constituents to be spiked or for RPDs.

2. Accuracy
Accuracy was assessed by analysis of laboratory method and trip blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the trip blank or any of the laboratory method blanks, with the following exception. Several CDD/CDF congeners were detected in the laboratory method blanks, which can be attributed to background conditions. As shown in the analytical reports, recoveries for all blank spikes, matrix spikes, and surrogates were within the acceptable range, with the following exceptions. The surrogate recoveries for all CDD/CDF congeners in DP38-081104-6-7 and the surrogate recovery for one CDD/CDF congener in DP36-081104-5-6 were outside of the surrogate control limits. It is standard protocol to re-extract and re-analyze a sample with poor surrogate recoveries such as DP38-081106-6-7, however, not enough sample volume was left to re-extract DP38-081104-6-7. Further J-flag qualification of the sample results with poor surrogate recovery was not necessary in accordance with the Pace Analytical Services case narrative. It should be noted that the QAPP (GeoEngineers 2008) did not specify expectations for constituents to be spiked or for expected recoveries.

3. Representativeness
Representativeness was assessed by evaluating the sample collection, sample handling, and sample analysis procedures. All samples were collected, handled, and analyzed in accordance with the SAP/QAPP (GeoEngineers, 2008), which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times.

4. Comparability
Comparability was assessed by comparing current sample collection and analysis procedures with standard procedures. The samples were collected and analyzed with standard procedures and were comparable with other data as qualified by the laboratories.

5. Sensitivity
Sensitivity was assessed by comparing actual practical quantification limits (PQLs) with the PQL expectations in the QAPP (GeoEngineers, 2008). The actual PQL was equal to or less than the expected PQL listed in the QAPP, with the following exceptions. The actual PQLs for 2,3,7,8-tetrachloro dibenzo-p-dioxin in DP36-081104-5-6, 1,2,3,4,7,8,9-heptachloro dibenzofuran in DP33-081104-7-8, and most CDD/CDF congeners in DP38-081104-6-7 were slightly above the PQL expectations listed in the QAPP. However, these actual PQLs were still acceptable for use. Thus, no further data qualification beyond what was reported by the laboratories was necessary. It should be noted that the QAPP (GeoEngineers 2008) did not specify PQL expectations for EPH, TOC, and metals other than arsenic, cadmium, and lead.

6. Completeness
Completeness was assessed by calculating the percentage of acceptable sample results to all sample results. A total of 104 analyses were performed (nine NWTPH-G, nine BTEX, eight NWTPH-Dx, 17 PAHs, 21 metals, 25 CDDs/CDFs, two chromium VI, three EPH, 10 TOC). All of the sample results were acceptable as qualified by the laboratories. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions
This data is deemed acceptable for use as presented by the laboratory. As a result, no corrective action or further data qualification is necessary.

Anatek Labs Report

CASE NARRATIVE November 12, 2008

Lab Name: Anatek Labs, Inc. 1282 Alturas Drive, Moscow, ID 83843 www.anateklabs.com *FL NELAP E87893, NV ID13-2004-31, WA DOE C126, OR ELAP ID200001, MT 0028, ID, CO, NM*

Project Tracking No.: EAST BAY RI PHASE 1
Anatek Batch: 081105018

Project Summary: Thirty-Three (33) soil samples were received on 11/5/2008. All samples were received with the appropriate chain of custody Samples were received at 7.9C. The requested analyses are summarized below. The TOC and EPH samples were held pending results of the initial round of analyses per the client request

Client Sample ID	Anatek Sample ID	TPHDx	TPHGx	BTEX	RCRA8	PAH	TOC	EPH	HOLD

Continuing Calibration(s) Valid?	Y	NA
Comments:	Y	NA

1. Holding Time Requirements

Samples were received above the recommended temperature range of 0-6C and were stored at 4C after arrival at the laboratory. This is not expected to negatively impact the results.

2. GC/MS Tune Requirements

No problems encountered

3. Calibration Requirements

No problems encountered.

4. Surrogate Recovery Requirements

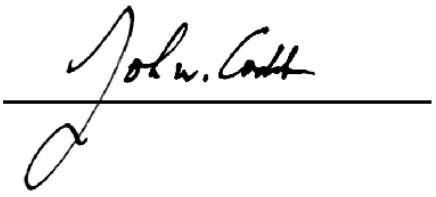
No problems encountered.

5. QC Sample (LCS/MS/MSD) Recovery Requirements

No problems encountered.

6. Method Blank Requirements

The method blanks were non-detect (<MDL) for all analytes. No problems encountered.



7. Internal Standard(s) Response Requirements

No problems encountered.

8. Comments

No problems encountered.

I certify that this data package is in compliance with the terms and conditions of the contract. Release of the data contained in this data package has been authorized by the Laboratory Manager or his designee.

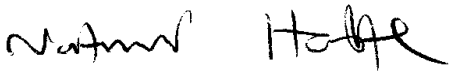
REPORT OF LABORATORY ANALYSIS FOR PCDD/PCDF

Report Information:



Pace Project #: 1083915
Sample Receipt Date: 11/05/2008
Client Project #: East Bay RI Phase I
Client Sub PO #: N/A
State Cert #: Idaho

Invoicing & Reporting Options:

The report provided has been invoiced as a Level 2 PCDD/PCDF Report. If an upgrade of this report package is requested, an additional charge may be applied.

Please review the attached invoice for accuracy and forward any questions to Nate Habte, your Pace Project Manager.

This report has been reviewed and prepared by:

Nate Habte, Project Manager

Fax: 612.607.6444

DISCUSSION

This report presents the results from the analyses performed on twenty-five samples submitted by a representative of Anatek Labs, Inc. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements. The samples received on 11/05/2008 were outside of the recommended temperature range of 0-6 degrees Celsius.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts generally ranged from 29-108%. All of the labeled standard recoveries obtained for sample DP38-081104-6-7 were below the 40-135% target range specified in Method 8290 and were flagged "P" on the results tables. Also, one low recovery was obtained for sample DP36-081104-5-6. Since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained. Pace Analytical Services will perform a repeat analysis of sample DP38-081104-6-7 at no charge if additional sample material is submitted within 30-days of this report.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained, or "E" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with each sample batch as part of our routine quality control procedures. The results show the blanks to contain trace levels of selected congeners. These were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory and matrix spike samples were also prepared using clean sand or sample matrix that had been fortified with native standard materials. The spiked native compounds were generally recovered at 72-130%, with relative percent differences of 0.5-18.2%. Somewhat variable background-subtracted results were obtained for the spiked native OCDD in the matrix spike samples due to the levels of this congener in the sample materials. Matrix spikes were prepared with the 11/19/2008 sample batch using sample material from a separate project; results from these analyses will be provided upon request.

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,

Fax: 612.607.6444

DISCUSSION

The responses obtained for the labeled OCDD and/or HpCDD in calibration standard analyses D81112B01 and D81112B02 were outside the target range. As specified in the method, the averages of the daily response factors for these compounds were used in the calculations for the samples from these runshifts. The affected values were flagged "Y" on the results tables. It should be noted that the accuracy of the native congener determinations was not impacted by these deviations.

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc.

Conc = Concentration (Totals include 2,3,7,8-substituted isomers).
EMPC = Estimated Maximum Possible Concentration
RL = Reporting Limit.

ND = Not Detected
NA = Not Applicable
NC = Not Calculated

Results reported on a dry weight basis and are valid to no more than 2 significant figures.
J = Value below calibration range
B = Less than 10x higher than method blank level
I = Interference present
Y = Calculated using average of daily RFs

Total HpCDF	ND	-----	0.21		(Using ITE Factors)		
1,2,3,4,6,7,8-HpCDD	ND	-----	0.25				
Total HpCDD	ND	-----	0.25				
OCDF	0.44	-----	0.34	J			
OCDD	0.56	-----	0.26	J			

Conc = Concentration (Totals include 2,3,7,8-substituted isomers).
EMPC = Estimated Maximum Possible Concentration
RL = Reporting Limit

Results reported on a total weight basis and are valid to no more than 2 significant figures.
J = Value below calibration range

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.
Sample preparation is defined by the client as per their Data Quality Objectives.
This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.
The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

Notes and Definitions

H7	Sample analysis performed past standard holding time but within project-specific holding time.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
R > 4S	% recovery not applicable, sample concentration more than four times greater than spike level
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable

Troy Bussey

From: John Coddington [john@anateklabs.com]

To: Troy Bussey
Subject: FW: W8K0325
Attachments: w8k0325-1.pdf; Anatek W8K0325-1.csv

Troy,

The results are reported as mg/L of sample extract. Their extraction multiplier is 8.333, which would make their reporting limit ~0.1 mg/Kg. Based on that, I hope the results are satisfactory.

John

John

We start with 3.0 grams of sample in 25ml so the conversion to mg/kgm would be times 8.333. I hope this is what you need.

Jim

Thanks Jim,

My client needs to know how that relates to the amount in the soil. In other words, corrected for the extraction multiplier.

John,
The Hex Cr is reported as mg/L extract.

Thank you.

PHASE 2 RI SOIL SAMPLING

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay RI Phase 2 – June 2009

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, all reported matrix spike duplicate RPDs were within the acceptable range.[1,2] Thus, further data qualification beyond what was reported by the laboratories was not necessary.

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks and recoveries in blank spikes, matrix spikes, and surrogates were within the acceptable range, with the following exceptions.[3,4] Several chlorinated dibenzo-p-dioxins (CDD) and chlorinated dibenzofurans (CDF) congeners were detected in the laboratory method blanks, which can be attributed to background conditions as discussed in the Pace Analytical Services case narrative. Sample results similar to the corresponding blank levels were flagged "B" by the laboratory and further data qualification beyond what was reported by the laboratory was not necessary. In addition, matrix spike and surrogate recoveries for several CDD/CDF congeners were outside the acceptable range as discussed in the Pace Analytical Services case narrative and qualified by the laboratory. Thus, further data qualification beyond what was reported by the laboratory was not necessary for the CDD/CDF results. Surrogate recoveries for BTEX were low for one sample (MW25S-061209-6.5-7.5). As a result, the BTEX results for this sample (which were non-detect) were assigned a UJ flag.

3. Representativeness

Representativeness was assessed by evaluating the sample collection, handling, preservation, and analysis procedures. With one exception, all samples were collected, handled, preserved, and analyzed in accordance with the Sampling and Analysis Plan (SAP)/QAPP (GeoEngineers 2008), which was designed to obtain representative samples. The reported temperature range in the sample coolers exceeded the recommended temperature range for preservation (or in some cases, the temperature was not recorded by the laboratory). All samples except for those for CDD/CDF analyses were hand-delivered on ice to the lab on the same day of collection. Samples for CDD/CDF analyses were delivered on ice via express mail to the laboratory on the day following collection. Since the samples were collected in the summer, delivered on ice, and delivered promptly to the laboratories, no additional data qualification is necessary. In addition, all samples were extracted and analyzed within appropriate holding times listed in the SAP/QAPP.

4. Comparability

Comparability was assessed by comparing current sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified by the laboratories.

5. Sensitivity

Sensitivity was assessed by comparing actual practical quantitation limits (PQLs) with PQL expectations. Because the laboratories selected to perform remedial investigation analyses were different than the presumptive laboratories at the time the SAP/QAPP was prepared, some of the SAP/QAPP PQL expectations were adjusted per personal correspondence between Troy Bussey of PIONEER and Steve Teel of the Washington State Department of Ecology (Ecology 2009). As shown in the following table,

---

[1] The approved Quality Assurance Project Plan (QAPP) (GeoEngineers 2008) did not specify expectations for RPDs; therefore, RPDs were evaluated based on control limits in the laboratory reports. When control limits were not provided by the laboratory, control limits from the Infrastructure Interim Action Work Plan (IAWP) (PIONEER Technologies Corporation [PIONEER] 2009) were utilized as appropriate.

[2] Control limit expectations for polychlorinated biphenyls (PCBs) were not defined in the laboratory reports, QAPP, or Infrastructure IAWP. The RPDs for PCBs, which ranged from 0.1% to 2.5%, were appropriate. Matrix spike duplicates were not prepared and analyzed by the laboratory for methods used to analyze total petroleum hydrocarbons in the gasoline range (TPH-G) and benzene, toluene, ethylbenzene, and xylenes (BTEX), and the arsenic and lead matrix spike RPDs were not presented in the analytical reports due to matrix interference.

[3] The approved QAPP (GeoEngineers 2008) did not specify expectations for recoveries with blank spikes, matrix spikes, and surrogates; therefore, recoveries were evaluated based on control limits in the laboratory reports. When control limits were not provided by the laboratory, control limits from the Infrastructure IAWP (PIONEER 2009) were utilized as appropriate.

[4] Control limit expectations for PCBs were not defined in the laboratory reports, QAPP, or Infrastructure IAWP. The blank spike recoveries (87.4% – 95.6%), the matrix spike recoveries (91.8% – 99.4%), and the surrogate recoveries (81.8% – 118%) for PCBs were appropriate. Matrix spikes for arsenic and lead were not presented in the analytical reports due to matrix interference.

the laboratories were able to achieve actual PQLs that were equal to or lower than the updated PQL expectations.

Constituent Type	Analytical Method	SAP/QAPP PQL Expectations (mg/kg)	Revised Target PQLs (Ecology 2009) (mg/kg)	Actual PQLs During This Investigation (mg/kg)
TPH in the Gasoline Range	Ecology NWTPH-Gx	5	5	5
TPH in the Diesel Range	Ecology NWTPH-Dx	5	25	25
TPH in the Heavy Oil Range	NWTPH-Dx	10	100	100
BTEX	USEPA SW846-8260/8021	0.001	0.1 – 0.5	0.05 – 0.1
Arsenic	USEPA SW846-6010/6020	5	0.25	0.25
Cadmium	USEPA SW846-6010/6020	0.2	0.25	0.25

Polycyclic Aromatic Hydrocarbons[(1)]	USEPA SW846-8270	0.005	0.01	0.01
Polychlorinated Biphenyls[(1)]	USEPA SW846-8082	0.004	0.025	0.025
Total CDD/CDFs TEQ[(2)]	USEPA SW846-8290	2.85E-05	5.0E-06	1.5E-07 – 3.7E-06

Notes:
TEQ: toxicity equivalency quotient
TPH: total petroleum hydrocarbons
USEPA: United States Environmental Protection Agency
(1) PQL values shown are for each constituent.
(2) Total PQL calculated using toxicity equivalency factors in Washington Administrative Code 173-340-708(8).

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 695 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory, subject to the qualifications noted in this document. No corrective action or additional data qualification is necessary.

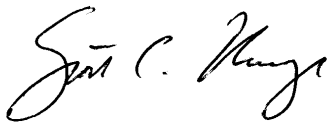
REPORT OF LABORATORY ANALYSIS FOR PCDD/PCDF

Report Information:



Pace Project #: 1097162
Sample Receipt Date: 06/12/2009
Client Project #: East Bay PH2 RI
Client Sub PO #: N/A
State Cert #: C218

Invoicing & Reporting Options:

The report provided has been invoiced as a Level 2 PCDD/PCDF Report. If an upgrade of this report package is requested, an additional charge may be applied.

Please review the attached invoice for accuracy and forward any questions to Scott Unze, your Pace Project Manager.

This report has been reviewed and prepared by:

Scott Unze, Project Manager

DISCUSSION

This report presents the results from the analyses performed on twelve samples submitted by a representative of Pioneer Technologies Corporation. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise calculations. The samples were received outside of the recommended temperature range of 0-6 degrees Celsius.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 17-130%. With the exceptions of eleven low values, which were flagged "P" on the results tables, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained, or "E" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were generally recovered at 82-115%, with relative percent differences of 0.9-14.4%. These results indicate generally high degrees of accuracy and precision for these determinations. Somewhat variable background-subtracted results were obtained for selected congeners in the matrix spike samples, due to the levels of these compounds in the sample material.

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc.

Fax: 612.607.6444

DISCUSSION

This report presents the results from the analyses performed on seven samples submitted by a representative of Pioneer Technologies Corporation. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise calculations.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 20-111%. With the exceptions of eleven low values, which were flagged "P" on the results tables, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained, or "E" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. The levels reported for the affected congeners in the field samples were higher than the corresponding blank levels by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field samples.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 89-115%. These results indicate a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc.

RE: Pioneer-6-10-08A
Fremont Project No: CHM090707-4
DAL Project No: 090610-8A

July 15th 2009

Attn:

Enclosed are the analytical results for the ***Pioneer-6-10-08A*** soil samples delivered (FedEx) to Fremont Analytical on Tuesday, July 7th 2009.

The samples were received in good condition – in the proper containers, properly sealed and labeled. The samples were contained in 3 – 4oz. soil jars. . The samples were received in a cooler with gel ice, with a cooler temperature of 6.9°C, which is within the laboratory recommended cooler temperature range (<4°C - 10°C). The samples were analyzed and then stored in a refrigeration unit at the USEPA-recommended temperature of 4°C ± 2°C. There were no sample analysis issues to report.

Examination of these samples was conducted for the presence of the following:

- ***Extractable Petroleum Hydrocarbons in Soil by NWEPH***

This application was performed under Washington State Department of Ecology accreditation parameters. All appropriate Quality Assurance / Quality Control method parameters have been applied.

Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical!

Sincerely,

Michael Dee
Sr. Chemist / Principal

Fax: 612.607.6444

DISCUSSION

This report presents the results from the analyses performed on nine samples submitted by a representative of Brown and Caldwell. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 37-124%. With the exception of one low value, which was flagged "P" on the results table, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners. The affected values were flagged "I" where incorrect isotope ratios were obtained, or "E" where polychlorinated diphenyl ethers were present.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 92-128%, with relative percent differences of 0.0-7.3%. These results indicate high degrees of accuracy and precision for these determinations.

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, Inc.

Sample Condition Upon Receipt

Pace Analytical

Client Name: Brown+Caldwell **Project #** 10112699

Courier: ☑ Fed Ex ☐ UPS ☐ USPS ☐ Client ☐ Commercial ☐ Pace Other _____

Tracking #: 8694 6070 3890

Custody Seal on Cooler/Box Present: ☑ yes ☐ no Seals intact: ☐ yes ☐ no

Optional: Proj. Due Date, Proj. Name

Packing Material: ☐ Bubble Wrap ☑ Bubble Bags ☐ None ☐ Other _____ Temp Blank: Yes ✓ No _____

Thermometer Used 80344042 or (179425) **Type of Ice:** (Wet) Blue None ☐ Samples on ice, cooling process has begun

Cooler Temperature 5-2 **Biological Tissue is Frozen:** Yes No

Temp should be above freezing to 6°C

Date and initials of person examining contents: 9/17/09 SH

Comments:

Chain of Custody Present:	☑Yes ☐No ☐N/A	1.
Chain of Custody Filled Out:	☐Yes ☐No ☐N/A	2.
Chain of Custody Relinquished:	☑Yes ☐No ☐N/A	3.
Sampler Name & Signature on COC:	☐Yes ☑No ☐N/A	4.
Samples Arrived within Hold Time:	☑Yes ☐No ☐N/A	5.
Short Hold Time Analysis (<72hr):	☐Yes ☑No ☐N/A	6.
Rush Turn Around Time Requested:	☐Yes ☑No ☐N/A	7.
Sufficient Volume:	☑Yes ☐No ☐N/A	8.
Correct Containers Used:	☑Yes ☐No ☐N/A	9.
-Pace Containers Used:	☑Yes ☐No ☐N/A	
Containers Intact:	☑Yes ☐No ☐N/A	10.
Filtered volume received for Dissolved tests	☐Yes ☑No ☐N/A	11.
Sample Labels match COC:	☑Yes ☐No ☐N/A	12.
-Includes date/time/ID/Analysis Matrix: SL		
All containers needing acid/base preservation have been checked. Noncompliance are noted in 13.	☐Yes ☐No ☑N/A	13. ☐ HNO3 ☐ H2SO4 ☐ NaOH ☐ HCl Samp #
All containers needing preservation are found to be in compliance with EPA recommendation.	☐Yes ☐No ☑N/A	
Exceptions: VOA,Coliform, TOC, Oil and Grease, WI-DRO (water)	☐Yes ☐No	Initial when completed / Lot # of added preservative
Samples checked for dechlorination:	☐Yes ☐No ☑N/A	14.
Headspace in VOA Vials (>6mm):	☐Yes ☐No ☑N/A	15.
Trip Blank Present:	☐Yes ☐No ☑N/A	16.
Trip Blank Custody Seals Present	☐Yes ☐No ☑N/A	
Pace Trip Blank Lot # (if purchased):

DATA GAP INVESTIGATION REGARDING THE SITE BOUNDARY DETERMINATION AND P-1 ANOMALY

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay Data Gap Investigation – October 2011 and February 2012

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, all matrix spike duplicate RPDs were within the acceptable range.[1] Thus, further data qualification beyond what was reported by the laboratories was not necessary.

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks and recoveries in blank spikes, matrix spikes, and surrogates were within the acceptable range, with the following exceptions.[2] Several chlorinated dibenzo-p-dioxins (CDD) and chlorinated dibenzofurans (CDF) congeners were detected in the laboratory method blanks, which can be attributed to background conditions as discussed in the Pace Analytical Services case narrative. Sample results similar to the corresponding blank levels were flagged "B" by the laboratory and further data qualification beyond what was reported by the laboratory was not necessary. In addition, matrix spike recoveries for several CDD/CDF congeners were outside the acceptable range as discussed in the Pace Analytical Services case narrative and qualified by the laboratory. Thus, further data qualification beyond what was reported by the laboratory was not necessary for the CDD/CDF results.

3. Representativeness

Representativeness was assessed by evaluating the sample collection, handling, preservation, and analysis procedures. All samples were collected, handled, preserved, and analyzed in accordance with the Sampling and Analysis Plan (SAP)/QAPP (GeoEngineers 2008), which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times listed in the SAP/QAPP.

4. Comparability

Comparability was assessed by comparing current sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified by the laboratories.

5. Sensitivity

Sensitivity was assessed by comparing actual practical quantitation limits (PQLs) with PQL expectations. Because the laboratories selected to perform remedial investigation analyses were different than the presumptive laboratories at the time the SAP/QAPP was prepared, some of the SAP/QAPP PQL expectations were adjusted per personal correspondence between Troy Bussey of PIONEER and Steve Teel of the Washington State Department of Ecology (Ecology 2009). As shown in the following table, the laboratories were able to achieve actual PQLs that were equal to or lower than the updated PQL expectations, with the exception of PCBs and one sample for PAHs analysis. However, these actual PQLs are acceptable for use since the resulting non-detect results are less than soil screening levels. Thus, further data qualification beyond what was reported by the laboratory was not necessary.

[1] The approved Quality Assurance Project Plan (QAPP) (GeoEngineers 2008) did not specify expectations for RPDs; therefore, RPDs were evaluated based on control limits in the laboratory reports. When control limits were not provided by the laboratory, control limits from the Infrastructure Interim Action Work Plan (IAWP) (PIONEER Technologies Corporation [PIONEER] 2009) were utilized as appropriate.

[2] The approved QAPP (GeoEngineers 2008) did not specify expectations for recoveries with blank spikes, matrix spikes, and surrogates; therefore, recoveries were evaluated based on control limits in the laboratory reports. When control limits were not provided by the laboratory, control limits from the Infrastructure IAWP (PIONEER 2009) were utilized as appropriate.

Constituent Type	Analytical Method	SAP/QAPP PQL Expectations (mg/kg)	Revised Target PQLs (Ecology 2009) (mg/kg)	Actual PQLs During This Investigation (mg/kg)
TPH in the Diesel Range	Ecology NWTPH-Dx	5	25	25

(1) PQL values shown are for each constituent.
(2) Total PQL calculated using toxicity equivalency factors in Washington Administrative Code 173-340-708(8).
(3) All but one sample had PQLs of 0.01 mg/kg for polycyclic aromatic hydrocarbons. The one sample had a PQL of 0.05 mg/kg due to necessary dilution.

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 524 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory. No corrective action or additional data qualification is necessary.

REPORT OF LABORATORY ANALYSIS FOR PCDD/PCDF

Report Prepared Date:
November 10, 2011

Report Information:

Pace Project #: 10173238
Sample Receipt Date: 10/20/2011
Client Project #: East Bay Redev
Client Sub PO #: N/A
State Cert #: C755

Invoicing & Reporting Options:

The report provided has been invoiced as a Level 2 PCDD/PCDF Report. If an upgrade of this report package is requested, an additional charge may be applied.

Please review the attached invoice for accuracy and forward any questions to Scott Unze, your Pace Project Manager.

This report has been reviewed by:

November 10, 2011

Fax: 612.607.6444

DISCUSSION

This report presents the results from the analyses performed on fifteen samples submitted by a representative of Pioneer Technologies Corporation. The samples were analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise calculations.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extracts ranged from 53-94%. All of the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Since the quantification of the native 2,3,7,8-substituted isomers was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDD or PCDF congeners; he affected values were flagged "I" where incorrect isotope ratios were obtained or "P" where polychlorinated diphenyl ethers were present. The OCDD concentration reported for sample DP52.101811-12-13.5 was above the calibration range, flagged "E," and should be regarded as an estimate.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain trace levels of selected congeners. These levels were below the calibration range of the method. Sample levels similar to the corresponding blank levels were flagged "B" on the results tables and may be, at least partially, attributed to the background. It should be noted that levels less than ten times the background are not generally considered to be statistically different from the background.

Laboratory and matrix spike samples were also prepared with the sample batch using clean sand or sample matrix that had been fortified with native standards. The results show that the spiked native compounds were generally recovered at 72-128%, with relative percent differences of 0.2-11.4%. The background-subtracted recovery value reported for OCDD in the matrix spike sample was above the 70-130% target range; this elevated value most likely resulted from the level of this congener in the sample material, which was relatively high compared to the spiked concentration.

C = Result obtained from confirmation analysis

D = Result obtained from analysis of diluted sample

E = Exceeds calibration range

I = Interference present

J = Estimated value

Nn = Value obtained from additional analysis

P = PCDE Interference

R = Recovery outside target range

S = Peak saturated

U = Analyte not detected

V = Result verified by confirmation analysis

X = %D Exceeds limits

Y = Calculated using average of daily RFs

* = See Discussion

Conc = Concentration (Totals include 2,3,7,8-substituted isomers).
EMPC = Estimated Maximum Possible Concentration
RL = Reporting Limit.

ND = Not Detected
NA = Not Applicable
NC = Not Calculated

Results reported on a dry weight basis and are valid to no more than 2 significant figures.
P = PCDE Interference
E = Exceeds calibration range
D = Result obtained from analysis of diluted sample

DATA GAP INVESTIGATION REGARDING THE SOIL-TO-INDOOR AIR PATHWAY

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay Redevelopment Site – May 2013 Sampling for the Soil-to-Indoor Air Pathway

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, matrix spike duplicate RPDs and laboratory control sample duplicate RPDs were within acceptable ranges identified in the Work Plan (WP; PIONEER 2013).

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks, and recoveries in the blank spikes, control samples, matrix spikes, and surrogates were within acceptable ranges identified in the WP (PIONEER 2013).

3. Representativeness

Representativeness was assessed by evaluating the sample collection, preservation, handling, and analysis procedures. All samples were collected, preserved, handled, and analyzed in accordance with the WP, which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times listed in the WP (PIONEER 2013).

The Summa canister for the equipment blank sample (EB-EB-1-050713) collected from the soil gas sampling system was found to be leaking upon arrival at the laboratory. The laboratory flagged all sample concentrations for that equipment blank sample with a "J" (estimated) qualifier. Further data qualification beyond what was reported by the laboratory was not necessary.

4. Comparability

Comparability was assessed by comparing the sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified.

5. Sensitivity

Sensitivity was assessed by comparing actual reporting limits (RLs) with target RLs (PIONEER 2013). The actual RLs were equal to or less than the target RLs with the following exceptions:

- The actual RL for soil samples analyzed for total petroleum hydrocarbons in the gasoline range (TPH-G) was 5 mg/kg, compared to the target RL of 2.5 mg/kg. However, the actual RL was acceptable since it was significantly less than the soil-to-indoor air screening level (SL) of 100 mg/kg (PIONEER 2013).
- The actual RLs for volatile organic compound analyses with soil gas samples SG-SVP-2SG-050713-2.5-3.0 and SG-SVP-2SG-050713-2.5-3.0-(01) were higher than the target RLs. However, these actual RLs were acceptable since it was necessary for the laboratory to perform dilutions due to high levels of target analytes.
- The actual RLs for soil gas and ambient air samples analyzed for oxygen, carbon dioxide, methane, nitrogen, helium were higher than the target RLs. However, these actual RLs were acceptable since there are no SLs for these compounds.

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 108 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory, subject to any qualifications noted in this document. No corrective action or additional data qualification is necessary.

Project #: East Bay Soil Gas
Workorder #: 1305235A

Dear Mr. Stacy Munson

The following report includes the data for the above referenced project for sample(s) received on 5/10/2013 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner

Project Manager

LABORATORY NARRATIVE
Modified TO-15
Pioneer Technologies Corporation
Workorder# 1305235A

Five 1 Liter Summa Canister (100% Certified) samples were received on May 10, 2013. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-15***	***ATL Modifications***
Initial Calibration	</=30% RSD with 2 compounds allowed out to < 40% RSD	</=30% RSD with 4 compounds allowed out to < 40% RSD
Blank and standards	Zero Air	UHP Nitrogen provides a higher purity gas matrix than zero air

Receiving Notes

The Chain of Custody (COC) information for sample SG-SVP-2SG-050713-2.5-3.0-(01) did not match the information on the canister with regard to canister identification. The client was notified of the discrepancy and the information on the canister was used to process and report the sample.

The summa canister for sample EB-EB-1-050713 was leaking upon arrival. Analyte concentrations reported from this sample are considered to be estimated.

Analytical Notes

Samples SG-SVP-2SG-050713-2.5-3.0 and SG-SVP-2SG-050713-2.5-3.0-(01) were diluted and transferred from Low Level analysis to full scan TO-15 due to high levels of target compounds.

The equipment blank sample EB-EB-1-050713 has reportable levels of target compounds present.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Workorder #: 1305235B

Dear Mr. Stacy Munson

The following report includes the data for the above referenced project for sample(s) received on 5/10/2013 at Air Toxics Ltd.

The data and associated QC analyzed by Modified ASTM D-1946 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Air Toxics Ltd. for your air analysis needs. Air Toxics Ltd. is committed to providing accurate data of the highest quality. Please feel free to contact the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner

Project Manager

LABORATORY NARRATIVE
Modified ASTM D-1946
Pioneer Technologies Corporation
Workorder# 1305235B

Five 1 Liter Summa Canister (100% Certified) samples were received on May 10, 2013. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane and fixed gases in air using GC/FID or GC/TCD. The method involves direct injection of 1.0 mL of sample.

On the analytical column employed for this analysis, Oxygen coelutes with Argon. The corresponding peak is quantitated as Oxygen.

Since Nitrogen is used to pressurize samples, the reported Nitrogen values are calculated by adding all the sample components and subtracting from 100%.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A 3-point calibration curve is performed. Quantitation is based on a daily calibration standard which may or may not resemble the composition of the associated samples.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

The Chain of Custody (COC) information for sample SG-SVP-2SG-050713-2.5-3.0-.(01) did not match the information on the canister with regard to canister identification. The client was notified of the discrepancy and the information on the canister was used to process and report the sample.

The summa canister for sample EB-EB-1-050713 was leaking upon arrival. Analyte concentrations reported from this sample are considered to be estimated.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.
File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

DATA GAP INVESTIGATION REGARDING POC GWM (SEPTEMBER 2014 DRILLING/SOIL SAMPLING)

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay POC – September 2014

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, all reported matrix spike duplicate RPDs were within the acceptable range identified in the Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP; PIONEER 2014).

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks and recoveries in blank spikes, matrix spikes, and surrogates were within the acceptable range in the SAP/QAPP (PIONEER 2014). Further data qualification beyond what was reported by the laboratory was not necessary.

3. Representativeness

Representativeness was assessed by evaluating the sample collection, handling, preservation, and analysis procedures. All samples were collected, handled, preserved, and analyzed in accordance with the SAP/QAPP, which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times listed in the SAP/QAPP (PIONEER 2014).

4. Comparability

Comparability was assessed by comparing current sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified.

5. Sensitivity

Sensitivity was assessed by comparing actual reporting limits (RLs) with target RLs. The laboratory was able to achieve actual RLs that were equal to or lower, with a couple of exceptions. However, deviations due to matrix interferences, necessary dilution prior to analysis, etc. from target RLs were addressed in the SAP/QAPP (PIONEER 2014).

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 105 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory, subject to any qualifications noted in this document. No corrective action or additional data qualification is necessary.

Project Tracking No.: EAST BAY POW GWM
Anatek Batch: 140923053

Project Summary: Three (3) samples, and one blank (WAVPH) were received on 9/23/2014. All samples were received with the appropriate chain of custody. Samples were received at 1.2C. The requested analyses are summarized below. VOC samples were collected in accordance with EPA 5035. VPH and EPH analysis were performed by ALS – Everett WA.

SAMPLE CONDITION RECORD

Samples received in a cooler?	Yes
Samples received intact?	Yes
What is the temperature inside the cooler?	1.2
Samples received with a COC?	Yes
Samples received within holding time?	Yes
Are all sample bottles properly preserved?	Yes
Are VOC samples free of headspace?	N/A
Is there a trip blank to accompany VOC samples?	Yes
Labels and chain agree?	Yes

DATA GAP INVESTIGATION REGARDING POC GWM (SEPTEMBER 2014 GWM)

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay Redevelopment Site – September 2014 GWM Event

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, matrix spike duplicate RPDs were within acceptable ranges identified in the Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP; PIONEER 2014).

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks, and recoveries in the blank spikes, matrix spikes, and surrogates were within acceptable ranges identified in the SAP/QAPP (PIONEER 2014).

3. Representativeness

Representativeness was assessed by evaluating the sample collection, preservation, handling, and analysis procedures. All samples were collected, preserved, handled, and analyzed in accordance with the SAP/QAPP, which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times listed in the SAP/QAPP (PIONEER 2014).

4. Comparability

Comparability was assessed by comparing current sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified.

5. Sensitivity

Sensitivity was assessed by comparing actual reporting limits (RLs) with target RLs (PIONEER 2014). The actual RLs were equal to or less than the target RLs.

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 49 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory, subject to any qualifications noted in this document. No corrective action or additional data qualification is necessary.

1. Holding Time Requirements

No problems encountered.

2. GC/MS Tune Requirements

No problems encountered

3. Calibration Requirements

No problems encountered.

4. Surrogate Recovery Requirements

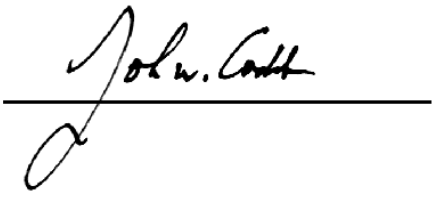
No problems encountered.

5. QC Sample (LCS/MS/MSD) Recovery Requirements

No problems encountered.

6. Method Blank Requirements

The method blanks were non-detect (<MDL) for all analytes. No problems encountered.



7. Internal Standard(s) Response Requirements

No problems encountered.

8. Comments

No problems encountered.

I certify that this data package is in compliance with the terms and conditions of the contract. Release of the data contained in this data package has been authorized by the Laboratory Manager or his designee.

SAMPLE CONDITION RECORD

Samples received in a cooler?	Yes
Samples received intact?	Yes
What is the temperature inside the cooler?	1.6
Samples received with a COC?	Yes
Samples received within holding time?	Yes
Are all sample bottles properly preserved?	Yes
Are VOC samples free of headspace?	Yes
Is there a trip blank to accompany VOC samples?	No
Labels and chain agree?	Yes

Table 4: Target Reporting Limits

Category	Analytical Method	Constituent	Target Reporting Limit [1]	Current Screening Level [2]
Soil constituents that may be used to establish site-specific soil and groundwater cleanup levels for TPH-D and TPH-HO	Ecology Method NWTPH-Dx	TPH-D	25 mg/kg	2,000 mg/kg [3]
		TPH-HO	100 mg/kg	
	USEPA Method SW846-8260 or SW846-8021	Benzene	0.005 mg/kg	0.22 mg/kg
		Toluene	0.005 mg/kg	240 mg/kg
		Ethylbenzene	0.005 mg/kg	43 mg/kg
		Total xylenes	0.010 mg/kg	23 mg/kg
	USEPA Method SW846-8270	Total naphthalenes	0.15 mg/kg	160 mg/kg
		Total cPAHs	0.076 mg/kg [4]	0.095 mg/kg
Groundwater constituents included in ongoing GWM	USEPA Method 200.8	Total arsenic	1.0 ug/L	Not applicable [5]
		Dissolved arsenic	1.0 ug/L	5.0 ug/L
	Ecology Method NWTPH-Dx	TPH-D	100 ug/L	500 ug/L [3]
		TPH-HO	500 ug/L	

Notes:

[1] It may not always be possible to achieve target reporting limits for reasons such as matrix interferences, necessary dilution prior to analysis, etc.

[2] The soil screening levels are from the 2009 interim action work plan associated with the infrastructure corridor (PIONEER 2009). The groundwater screening levels are the surface water screening levels from the 2011 empirical evaluation of the soil-to-surface water via groundwater pathway (PIONEER 2011).

[3] The concentrations of TPH-D and TPH-HO are currently being combined per Ecology direction (Ecology 2013a, 2013b). However, NWTPH-HCID analyses will be conducted pursuant to this SAP/QAPP to inform the nature of petroleum products present at the Site so that it can be determined if TPH-D and TPH-HO should be combined or separated.

[4] The target reporting limit is 0.05 mg/kg for each PAH constituent. The target reporting limit shown is a total cPAHs target reporting limit by applying the toxicity equivalency factors in WAC 173-340-708(8) for the seven cPAH constituents.

[5] Compliance with groundwater screening levels for metals is being evaluated using dissolved concentrations (PIONEER 2011).

To: John Coddington <john@anateklabs.com>
Subject: Samples with 10/1/2014 arrival

Hi John:
Since I'm sure my COC is confusing, I wanted to reiterate the following:

- NWTPH-HCID needs to be run prior to NWTPH-Dx (as I believe you and Troy discussed
- Silica gel clean-up needs to be performed for NWTPH-Dx analyses
- Dissolved arsenic needs to be lab-filtered
- Target RLs are attached

I also wrote that the trip blanks don't need to be run but I don't think I put them in those coolers (they are in a slower box that will come later this week), so please ignore that note.

-Thanks,

-Shella

Subject: 141002002 PITC

They need TPHDx added on to these four waters (1-4).

Per Troy Bussey via phone call today. **Justin, I will need a new LR and COC scanned and login updated.**
Kris, I will need you to enter the results **that you already have for TPHDx for these (we did HCID's)**

I need to get him the updated report by tomorrow.

DATA GAP INVESTIGATION REGARDING POC GWM (DECEMBER 2014 GWM EVENT AND FEBRUARY 2015 RE-SAMPLE OF MW12)

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay Redevelopment Site – December 2014/February 2015[1] GWM Event

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, matrix spike duplicate RPDs were within acceptable ranges identified in the Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP; PIONEER 2014).

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks, and recoveries in the blank spikes, matrix spikes, and surrogates were within acceptable ranges identified in the SAP/QAPP (PIONEER 2014).

3. Representativeness

Representativeness was assessed by evaluating the sample collection, preservation, handling, and analysis procedures. All samples were collected, preserved, handled, and analyzed in accordance with the SAP/QAPP, which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times listed in the SAP/QAPP (PIONEER 2014).

4. Comparability

Comparability was assessed by comparing current sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified.

5. Sensitivity

Sensitivity was assessed by comparing actual reporting limits (RLs) with target RLs (PIONEER 2014). The actual RLs were equal to or less than the target RLs.

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 22 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory, subject to any qualifications noted in this document. No corrective action or additional data qualification is necessary.

Continuing Calibration(s) Valid?	Y	NA
Comments:	Y	NA

1. Holding Time Requirements

No problems encountered.

2. GC/MS Tune Requirements

No problems encountered

3. Calibration Requirements

No problems encountered.

4. Surrogate Recovery Requirements

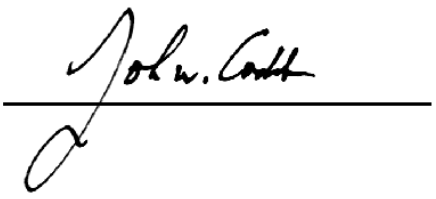
No problems encountered.

5. QC Sample (LCS/MS/MSD) Recovery Requirements

No problems encountered.

6. Method Blank Requirements

The method blanks were non-detect (<MDL) for all analytes. No problems encountered.



7. Internal Standard(s) Response Requirements

No problems encountered.

8. Comments

No problems encountered.

I certify that this data package is in compliance with the terms and conditions of the contract. Release of the data contained in this data package has been authorized by the Laboratory Manager or his designee.

DATA GAP INVESTIGATION REGARDING POC GWM (MARCH 2015 GWM EVENT)

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay Redevelopment Site – March 2015 GWM Event

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, matrix spike duplicate RPDs were within acceptable ranges identified in the Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP; PIONEER 2014).

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks, and recoveries in the blank spikes, matrix spikes, and surrogates were within acceptable ranges identified in the SAP/QAPP (PIONEER 2014).

3. Representativeness

Representativeness was assessed by evaluating the sample collection, preservation, handling, and analysis procedures. All samples were collected, preserved, handled, and analyzed in accordance with the SAP/QAPP, which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times listed in the SAP/QAPP (PIONEER 2014).

4. Comparability

Comparability was assessed by comparing current sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified.

5. Sensitivity

Sensitivity was assessed by comparing actual reporting limits (RLs) with target RLs (PIONEER 2014). The actual RLs were equal to or less than the target RLs.

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 20 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory, subject to any qualifications noted in this document. No corrective action or additional data qualification is necessary.

CASE NARRATIVE April 13, 2015

Lab Name: Anatek Labs, Inc. 1282 Alturas Drive, Moscow, ID 83843 www.anateklabs.com *FL NELAP E87893, NV ID13-2004-31, WA DOE C126, OR ELAP ID200001, MT 0028, ID, CO, NM*

Project Tracking No.: EAST BAY
Anatek Batch: 150331029

Project Summary: Five (5) water samples were received on 3/31/2015. All samples were received with the appropriate chain of custody. Samples were received at 2.5C. All samples were analyzed for total and dissolved arsenic and NW-TPHDx (with silica gel/acid cleanup)

QA/QC Checks

Parameters	Yes / No	Exceptions / Deviations
Sample Holding Time Valid?	Y	NA
Surrogate Recoveries Valid?	Y	NA
QC Sample(s) Recoveries Valid?	Y	NA
Method Blank(s) Valid?	Y	NA
Tune(s) Valid?	Y	NA
Internal Standard Responses Valid?	Y	NA
Initial Calibration Curve(s) Valid?	Y	NA
Continuing Calibration(s) Valid?	Y	NA
Comments:	Y	NA

1. Holding Time Requirements

No problems encountered.

2. GC/MS Tune Requirements

No problems encountered

3. Calibration Requirements

No problems encountered.

4. Surrogate Recovery Requirements

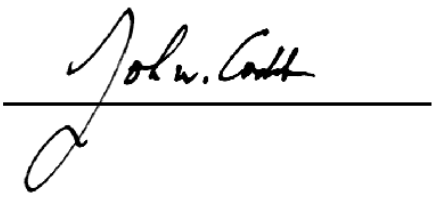
No problems encountered.

5. QC Sample (LCS/MS/MSD) Recovery Requirements

No problems encountered.

6. Method Blank Requirements

The method blanks were non-detect (<MDL) for all analytes. No problems encountered.



7. Internal Standard(s) Response Requirements

No problems encountered.

8. Comments

No problems encountered.

I certify that this data package is in compliance with the terms and conditions of the contract. Release of the data contained in this data package has been authorized by the Laboratory Manager or his designee.

SAMPLE CONDITION RECORD

Samples received in a cooler?	Yes
Samples received intact?	Yes
What is the temperature of the sample(s)? (°C)	2.5
Samples received with a COC?	Yes
Samples received within holding time?	Yes
Are all sample bottles properly preserved?	Yes
Are VOC samples free of headspace?	N/A
Is there a trip blank to accompany VOC samples?	N/A
Labels and chain agree?	Yes

DATA GAP INVESTIGATION REGARDING POC GWM (JUNE 2015 GWM EVENT)

This page has been left blank intentionally to allow for double-sided printing.

Data Quality Review
East Bay Redevelopment Site – June 2015 GWM Event

1. Precision

Precision was assessed via the relative percent difference (RPD) for matrix spike duplicates. As shown in the analytical reports, matrix spike duplicate RPDs were within acceptable ranges identified in the Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP; PIONEER 2014).

2. Accuracy

Accuracy was assessed by analysis of laboratory method blanks as well as recoveries in blank spikes, matrix spikes, and surrogates. As shown in the analytical reports, no constituents were detected in the laboratory method blanks, and recoveries in the blank spikes, matrix spikes, and surrogates were within acceptable ranges identified in the SAP/QAPP (PIONEER 2014).

3. Representativeness

Representativeness was assessed by evaluating the sample collection, preservation, handling, and analysis procedures. All samples were collected, preserved, handled, and analyzed in accordance with the SAP/QAPP, which was designed to obtain representative samples. In addition, all samples were extracted and analyzed within appropriate holding times listed in the SAP/QAPP (PIONEER 2014).

4. Comparability

Comparability was assessed by comparing current sample collection and analysis procedures with historical procedures. The samples were collected and analyzed with standard procedures and are comparable with other site data as qualified.

5. Sensitivity

Sensitivity was assessed by comparing actual reporting limits (RLs) with target RLs (PIONEER 2014). The actual RLs were equal to or less than the target RLs.

6. Completeness

Completeness was assessed by calculating the percentage of useable results to all results. A total of 20 sample analyses were performed. All of the analyte results are useable as qualified. Thus, the completeness of the analytical data is 100 percent.

7. Conclusions

This data is deemed acceptable for use as presented by the laboratory, subject to any qualifications noted in this document. No corrective action or additional data qualification is necessary.

CASE NARRATIVE June 23, 2015

Lab Name: Anatek Labs, Inc. 1282 Alturas Drive, Moscow, ID 83843 www.anateklabs.com *FL NELAP E87893, NV ID13-2004-31, WA DOE C126, OR ELAP ID200001, MT 0028, ID, CO, NM*

Project Tracking No.: EAST BAY
Anatek Batch: 150610061

Project Summary: Five (5) water samples were received on 6/10/2015. All samples were received with the appropriate chain of custody. Samples were received at 3.3C. All samples were analyzed for total and dissolved arsenic and NW-TPHDx (with silica gel/acid cleanup)

QA/QC Checks

Parameters	Yes / No	Exceptions / Deviations
Sample Holding Time Valid?	Y	NA
Surrogate Recoveries Valid?	Y	NA
QC Sample(s) Recoveries Valid?	Y	NA
Method Blank(s) Valid?	Y	NA
Tune(s) Valid?	Y	NA
Internal Standard Responses Valid?	Y	NA
Initial Calibration Curve(s) Valid?	Y	NA
Continuing Calibration(s) Valid?	Y	NA
Comments:	Y	NA

1. Holding Time Requirements

No problems encountered.

2. GC/MS Tune Requirements

No problems encountered

3. Calibration Requirements

No problems encountered.

4. Surrogate Recovery Requirements

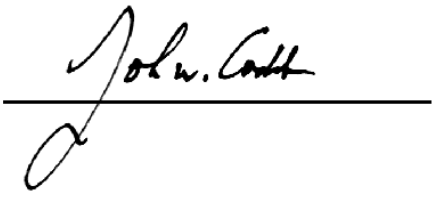
No problems encountered.

5. QC Sample (LCS/MS/MSD) Recovery Requirements

No problems encountered.

6. Method Blank Requirements

The method blanks were non-detect (<MDL) for all analytes. No problems encountered.



7. Internal Standard(s) Response Requirements

No problems encountered.

8. Comments

No problems encountered.

I certify that this data package is in compliance with the terms and conditions of the contract. Release of the data contained in this data package has been authorized by the Laboratory Manager or his designee.

SAMPLE CONDITION RECORD

Samples received in a cooler?	Yes
Samples received intact?	Yes
What is the temperature of the sample(s)? (°C)	3.3 / 4.7
Samples received with a COC?	Yes
Samples received within holding time?	Yes
Are all sample bottles properly preserved?	Yes
Are VOC samples free of headspace?	N/A
Is there a trip blank to accompany VOC samples?	N/A
Labels and chain agree?	Yes

BROWN AND CALDWELL

BORING LOG

Project Name: East Bay Parcel 4 and 5 Well Number: DP45b

Soil Boring [X] Monitoring Well [ ] Project Number: 138130 Sheet 1 of 1

Boring Location: Parcel 4 / Parcel 5		Elevation:	
Drilling Contractor: ESN Northwest	Driller: Marty	Date Started: 090916	Date Finished: 090916
Drilling Equipment: Geoprobe	Borehole Diameter: 2"	Depth: 8'	Water Depth: 6'
Sampling Method: Soil from acetate sleeve		Well Casing (type, diam.): NA	
Drilling Method: Direct Push	Drilling Fluid: NA	Well Screen (type,diam.): NA	
Backfill Material: Bentonite	Well Seal: NA	Slot Size: NA	Filter Material: NA
Logged By: **Brown and Caldwell**	Checked By:	Development Method: NA	

Depht (feet)	USC Soil Type	Description	Blow Counts	Sample No.	Graphic Log: Sample	Graphic Log: Lithology	Graphic Log: Well	Readings (ppm)	Remarks
		Sand (brown) with rocks		10					Surface disturbed by construction
		No Recovery							
5		Sand (brown) with rocks							2nd boring placed side-by-side with DP45a due to poor recovery in first 8' of DP45a
		Sand, brown to grey		60

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Results that are italicized are no longer in place.

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

(1) Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in soil and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in soil. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level
CON: Confirmation analysis
D: Result obtained from analysis of diluted sample
E: Exceeds calibration range
I: Interference present
J: Estimated value
P: Polychlorinated diphenyl ether interference
U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

Notes:

--: Not analyzed

Qualifier

B: Less than 10x higher than the method blank level

CON: Confirmation analysis

D: Result obtained from analysis of diluted sample

E: Exceeds calibration range

I: Interference present

J: Estimated value

P: Polychlorinated diphenyl ether interference

U: Not detected at shown concentration

Results are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number and dioxins/furans are shown in scientific notation to two significant figures.

[1] Compound totaling was performed in accordance with Ecology's amendments to MTCA (Ecology 2001a). For congeners that occur at the Site (detected in any medium), but not detected in that sample, a value of half the detection limit was assigned. For congeners that do not occur at the Site (not detected in any medium), a value of zero was assigned. In the case of cPAHs, all congeners were detected at least once in Groundwater and groundwater. In the case of total dioxins/furans, all congeners were detected at least once in Groundwater. Therefore, cPAHs and total dioxins/furans that were not detected were assigned a value of half the detection limit.

[2] MW12 was resampled in February 2015.

SECTION 1 – SOIL SLS AND COPCS

The purpose of this section is to present the methodology used to determine soil screening levels (SLs) and soil constituents of potential concern (COPCs) for the East Bay Redevelopment Site (Site).

1.1 Exposure Pathways for Quantification of Soil SLs

A conceptual site exposure model (CSEM) is presented in Figure 2-13 of the main text, and discussed in Section 2.8 and Appendix G of the main text. As presented in Figure 2-13, Section 2.8, and Appendix G of the main text, the following CSEM pathways were identified for consideration in the quantification of soil SLs:

- Direct contact (incidental ingestion and dermal contact) with soil and inhalation of particulates by:
  - Single-family residents.
  - Commercial workers.
  - Construction/utility workers during the remediation and redevelopment construction phase.
  - Utility maintenance workers during the post-remediation and post-redevelopment phase.
- For total petroleum hydrocarbons (TPH) in the gasoline range (TPH-G) and total naphthalenes only, inhalation of vapors by:
  - Single-family residents.
  - Commercial workers.
  - Commercial workers during the post-redevelopment land use phase.
- For arsenic, TPH in the diesel range (TPH-D) and TPH in the heavy oil range (TPH-HO) combined only, direct contact (incidental ingestion and dermal contact) with East Bay surface water and sediment, as well as consumption of East Bay seafood, by recreators, subsistence fishers, and aquatic organisms during all land use phases.

Consistent with Model Toxics Control Act (MTCA) regulations, single-family residential exposure assumptions were used to quantify SLs for the soil direct contact, inhalation of particulates, and inhalation of vapors pathways in order to develop more protective SLs.

1.2 Soil COIs

As discussed in Section 3.1 of the main text, soil samples collected during the remedial investigation (RI) were analyzed for a variety of constituents of interest (COIs). A COI is defined as any constituent that was analyzed in on-site RI soil samples, including samples that were removed during an Interim Action (IA), and samples that were subsequently replaced with a co-located sample. A summary of analytical laboratory results for each soil COI is presented in Table M-1. As shown in Table M-1, 48 COIs were detected in on-site soil samples.

1.3 Development of Soil SLs for Detected COIs

Soil SLs were developed for COIs detected in any on-site RI soil sample. The SLs were based on single-family residential land use (i.e., unrestricted land use) in order to develop more protective SLs consistent with MTCA requirements even though there is no current residential land use and zoning does not allow future single-family residential land use. Nonetheless, soil SLs for unrestricted land use were developed using the most stringent of the following values, subject to any necessary adjustments per Washington Administrative Code (WAC) 173-340-740(5)(c):

- Soil concentrations protective of the inhalation of particulates pathway in an unrestricted land use scenario (see Tables M-2 and M-3).
- Soil concentrations protective of the direct contact (incidental ingestion and dermal contact) pathway in an unrestricted land use scenario (see Tables M-4 and M-5).
- MTCA Method A Soil Cleanup Levels for Unrestricted Land Uses for TPH-G and total naphthalenes in order to be protective of the soil-to-indoor air pathway (PIONEER 2014).
- Arsenic and TPH-D and TPH-HO combined soil concentrations protective of the soil-to-surface water (via groundwater) pathway (see Table M-6).

The resulting soil SL for unrestricted land use for each detected COI is presented in Table M-7.

1.4 Determination of Soil COPCs

Soil COPCs were determined by comparing the following maximum detected concentrations for each detected COI with the soil SLs determined in Table M-7:

- The maximum detected concentration in on-site RI soil samples (from Table M-1).
- The maximum detected concentration in Infrastructure IA soil stockpile samples (PIONEER 2010).
- The maximum detected concentration in Parcel 4/5 IA soil stockpile samples (Brown and Caldwell 2015).

A detected COI was identified as a soil COPC if any of the aforementioned maximum detected concentrations exceeded the soil SL. As shown in Table M-8, the following COIs were identified as soil COPCs:

- Arsenic
- Lead
- TPH-G
- Total naphthalenes
- TPH-D and TPH-HO combined
- Total carcinogenic polycyclic aromatic hydrocarbons (cPAHs)
- Total chlorinated dibenzo-p-dioxins and chlorinated dibenzofurans (dioxins/furans)

SECTION 2 – SOIL RLS

The purpose of this section is to present the methodology used to determine soil remediation levels (RLs) for the seven soil COPCs (see Section 1.4). Soil RLs were developed for soil COPCs based on a commercial land use scenario, with the exception that MTCA Method A Soil Cleanup Levels for Unrestricted Land Use for TPH-G and total naphthalenes were used to be protective of the soil-to-indoor air pathway per prior agreement (PIONEER 2014). Consistent with MTCA regulations, the protective exposure assumptions for commercial workers were used as surrogates for construction/utility worker exposures and utility maintenance worker exposures during the development of soil RLs. Thus, soil RLs were developed using the most stringent of the following values as shown in Table M-9:

- Soil concentrations protective of the inhalation of particulates pathway in a commercial land use scenario (see Tables M-2 and M-3).
- Soil concentrations protective of the direct contact (incidental ingestion and dermal contact) pathway in in a commercial land use scenario (see Tables M-4 and M-5).
- MTCA Method A Soil Cleanup Levels for Unrestricted Land Uses for TPH-G and total naphthalenes in order to be protective of the soil-to-indoor air pathway (PIONEER 2014).
- Arsenic and TPH-D and TPH-HO combined soil concentrations protective of the soil-to-surface water (via groundwater) pathway (see Table M-6).
- The MTCA Method A Cleanup Level for TPH-G if benzene is present was not used for the following reasons (Ecology 2016, PIONEER 2016):
    - Out of 104 on-site soil samples analyzed for benzene, benzene was only "detected" in three soil samples at the Site (see Table M-10). However, in all three cases the "J" qualified detections were less than the RL. The laboratory presented these results as "J" qualified detections because the concentrations were greater than the method detection limit, but less than the associated RL. The maximum of the three "J" qualified detected benzene concentrations was 0.011 J mg/kg, which is less than the MTCA Method A Soil Cleanup Level for Unrestricted Land Use of 0.03 mg/kg.
    - Only a few non-detect benzene results had a RL significantly greater than the MTCA Method A Soil Cleanup Level for Unrestricted Land Use of 0.03 mg/kg. For the purposes of this report, a target RL of greater than two times 0.03 mg/kg was considered a significantly elevated RL since it is a common convention to assume a non-detect result equals half the RL. As shown on Figure M-1, only three in-place soil samples had a non-detect RL greater than 0.06 mg/kg: a MW15 sample with a 0.075 mg/kg RL, a DP15 sample with a 0.076 mg/kg RL, and a DP06 sample with a 0.75 mg/kg RL. The DP06 soil sample will be removed pursuant to the recommended alternative.
    - Sample locations MW15 and DP15 were collected below the water table (10-12 feet below ground surface). The Method A Soil Cleanup Level for benzene is based on the protection of groundwater for drinking water use.
    - Actual RLs are often higher than ideal target RLs for legitimate reasons such as matrix interferences, necessary sample dilutions, laboratory equipment capabilities, et cetera.

Soil SLs and soil RLs for the soil COPCs are presented in Table M-11.

SECTION 3 – GROUNDWATER SLS

The purpose of this section is to present the methodology used to determine groundwater SLs for the two groundwater COPCs (dissolved arsenic, and TPH-D and TPH-HO combined) that were previously established (PIONEER 2011). In accordance with the CSEM, groundwater SLs were developed to be protective of all potential surface water receptors. Groundwater SLs were developed in accordance with the MTCA Method B surface water cleanup level requirements in WAC 173-340-730(3)(b) subject to any necessary natural background adjustments per WAC 173-340-730(5)(c). The development of groundwater SLs is presented in Table M-12.

This page has been left blank intentionally to allow for double-sided printing.

Legend

- Site Boundary
- Constituent Delineation for TPH-G and Total Naphthalenes Only

Soil Data (0-2' bgs)
- NLIP Due to Past Soil Removal
- Not Detected with RL <= 0.06 mg/kg
- Detected <= 0.03 mg/kg
- Not Detected with RL > 0.06 mg/kg

Soil Data (2-6' bgs)
- NLIP Due to Past Soil Removal
- Not Detected with RL <= 0.06 mg/kg
- Detected <= 0.03 mg/kg
- Not Detected with RL > 0.06 mg/kg

Soil Data (>=6' bgs)
- NLIP Due to Past Soil Removal
- Not Detected with RL <= 0.06 mg/kg
- Detected <= 0.03 mg/kg
- Not Detected with RL > 0.06 mg/kg

Notes:
ft bgs: feet below ground surface
NLIP: No Longer in Place
RL: Reporting Limit
U: Not detected at shown RL

The MTCA Method A soil cleanup level for unrestricted land uses is 0.03 mg/kg. Non-detect results are shown relative to 0.06 mg/kg since a common convention is to assume non-detected results equal half the RL.

Notes:

--: Constituent was not detected.

N/A: Not applicable

PQL: Practical quantitation limit

Concentrations are shown as two significant figures in standard notation with the exception that numbers greater than 100 are rounded to a whole number.

[1] Constituents that were analyzed in any on-site RI sample, including samples that are no longer in place because the associated soil was subsequently removed during an IA and samples that were subsequently replaced with a co-located sample.

[2] Total cPAHs and total dioxins/furans concentrations were calculated using toxic equivalency factors based on the toxicity of benzo(a)pyrene and 2,3,7,8-tetrachlorodibenzo-p-dioxin, respectively, in accordance with WAC 173-340-708(8).

[3] Individual cPAHs were not identified as COPCs in accordance with WAC 173-340-708(8)(e).

Table M-2: Equations and Parameters for the Inhalation of Particulates Pathway Calculations

Non-Carcinogenic Level (mg/kg) [1]			$= \frac{RfDi * HQ * ABW * AT * 365\ days/year * PEF}{IR * EF * ED}$			
Carcinogenic Level (mg/kg) [1]			$= \frac{Risk * ABW * AT * 365\ days/year * PEF}{CPFi * IR * EF * ED}$

CPFo	Oral Cancer Potency Factor	kg-day/mg	N/A	Chemical-specific	N/A	Chemical-specific
CPFd	Dermal Cancer Potency Factor	kg-day/mg	N/A	Chemical-specific [4]	N/A	Chemical-specific [4]

Notes:

[1] From MTCA Equation 740-4 for non-carcinogenic levels and Equation 740-5 for carcinogenic levels.

[2] Default exposure assumptions for a child resident from WAC 173-340-740(3)(c)(iii).

[3] Default exposure assumptions for an adult worker from WAC 173-340-745(5)(c)(iii).

[4] Per the defaults in MTCA Equation 740-4, RfDd = RfDo x GI. Per the defaults in MTCA Equation 740-5, CPFd = CPFo/GI.

[5] Used 0.6 for mixtures of dioxins/furans per WAC 173-340-740(3)(c)(iii) and WAC 173-340-745(5)(c)(iii).

[6] The following dermal adsorption factors were used per WAC 173-340-740(3)(c)(iii) and WAC 173-340-745(5)(c)(iii):
0.01 for inorganic hazardous substances,
0.0005 for volatile organic compounds (VOCs) with vapor pressure >= benzene,
0.03 for VOCs with vapor pressure < benzene and for mixtures of dioxins/furans, or
0.1 for other organic hazardous substances.

[7] The following gastrointestinal adsorption factors were used per WAC 173-340-740(3)(c)(iii) and WAC 173-340-745(5)(c)(iii):
0.2 for inorganic constituents,
0.8 for VOCs and for dioxins/furans, or
0.5 for other organic hazardous substances.

Notes:

--: No value could be directly calculated since appropriate toxicity information was unavalaible.

Values less than 100 are shown as two significant figures in standard notation. Values greater than 100 are rounded to a whole number.

[1] Values obtained from CLARC (Ecology 2015b).

[2] The most stringent of the calculated non-carcinogenic and carcinogenic values is the resulting soil SL.

[3] Benzo(a)pyrene, 2,3,7,8-tetrachlorodibenzo-p-dioxin, and naphthalene were used to calculate SLs for total cPAHs, total dioxins/furans, and total naphthalenes, respectively, per WAC 173-340-708(8) and footnotes on MTCA Tables 740-1 and 745-1.

[4] Screening levels are based on values for chromium (III) because chromium (VI) has not been detected at the Site, including in two of the three soil samples that exceeded the accepted Puget Sound area background concentration for total chromium of 48 mg/kg (Ecology 1994).

[5] Site-specific extractable petroleum hydrocarbons (EPH) data were used for this calculation as shown in Attachment M-1. Specifically, EPH data from soil sample SO-DP-57-092214-3-5 were used since that sample had the highest TPH concentration of any site-specific EPH sample. In accordance with Ecology guidance, (1) a non-detect EPH fraction was assigned a value of half the reporting limit if that EPH fraction was detected in any EPH sample, and (2) a non-detect EPH fraction was assigned a value of zero if that EPH fraction was not detected in any EPH sample (Ecology 2011). The unrestricted land use SL calculation used MTCA Equation 740-3 per WAC 173-340-740(3)(b)(iii)(B)(III). The commercial/industrial land use SL calculation used MTCA Equation 745-3 per WAC 173-340-745(5)(b)(iii)(B)(III).

[6] Default direct contact values for TPH-G and mercury (which do not have CLARC values) from Ecology guidance (Ecology 2001a, 2001b) with the exception that a TPH-G value of 1,500 mg/kg was used for the unrestricted land use scenario (Ecology 2016).

[7] Alkylbenzenes and non-carcinogenic polycyclic aromatic hydrocarbons are components of petroleum products that are accounted for in the TPH screening levels (e.g., see footnote 14a in MTCA Table 830-1).

[8] Adjusted to accepted background concentration of 20 mg/kg per WAC 173-340-740(5)(c) (see MTCA Table 740-1 footnote b).

[9] MTCA Method A soil cleanup levels for lead.

Table M-5: Soil SL Calculations for the Direct Contact (Ingestion and Dermal) Pathway

Detected Constituents of Interest	Calculated Noncarcinogenic Values for Unrestricted Land Use [1] (mg/kg)	Calculated Carcinogenic Values for Unrestricted Land Use [1] (mg/kg)	Resulting Soil SLs for the Direct Contact Pathway in an Unrestricted Land Use Scenario [2] (mg/kg)	Calculated Noncarcinogenic Values for Commercial Land Use [1] (mg/kg)	Calculated Carcinogenic Values for Commercial Land Use [1] (mg/kg)	Resulting Soil SLs for the Direct Contact Pathway in a Commercial Land Use Scenario [2] (mg/kg)

[10] The resulting soil SLs for an unrestricted land use scenario were adjusted down to 4,700 mg/kg so that the cumulative hazard index for TPH-G plus TPH-D and TPH-HO combined does not exceed 1.0 (PIONEER 2016).

Table M-6: Soil SL Calculations for the Soil-to-Surface Water (via Groundwater) Pathway

Constituent	MTCA Soil Concentrations for Protection of Surface Water Receptors [1] (mg/kg)	LNAPL Residual Saturation Criterion (mg/kg)	Resulting Soil SLs for the Soil-to-Surface Water (via Groundwater) Pathway [2] (mg/kg)
Arsenic	20 [3]	Not applicable for arsenic	20
TPH-D and TPH-HO Combined	Not applicable based on results from the four-phase partitioning model [4]	24,000 [5]	24,000

Notes:

LNAPL: Light non-aqueous phase liquid

[1] Soil concentration that will be protective of the groundwater SL (see Table M-11). The groundwater SL is based on protection of surface water receptors.

[2] The most stringent of the MTCA soil concentration for protection of surface water receptors and the LNAPL residual saturation criterion.

[3] The calculated soil concentration for the protection of the groundwater SL per WAC 173-340-747(4) is less than the accepted natural background concentration (PIONEER 2009). Thus, the concentration was adjusted to the accepted background concentration of 20 mg/kg per WAC 173-340-740(5)(c) (see MTCA Table 740-1 footnote b).

[4] As shown in Attachment M-1, the MTCA four-phase partitioning model results based on site-specific EPH data indicated that TPH-D and TPH-HO are not a concern for the soil-to-surface water (via groundwater) pathway at any soil concentration less than pure LNAPL. In other words, this WAC 173-340-747(6) calculation indicated TPH-D and TPH-HO in soil are unlikely to impact surface water given the composition of petroleum hydrocarbons present at the Site. This site-specific result is consistent with the four-phase partitioning model results used to determine the MTCA Method A soil cleanup levels for TPH-D and TPH-HO (Ecology 2001a, 2001b).

[5] Although LNAPL measurement data empirically demonstrated that Site soil concentrations have not caused an accumulation of LNAPL on or in groundwater in accordance with WAC 173-340-747(10)(c) (see Section 3 of the main text for the LNAPL measurement data), a 24,000 mg/kg (maximum concentration at Site) value was used per Ecology request (PIONEER 2016).

Notes:

J: Estimated concentration

NA: Not analyzed

ND: Constituent not detected in any sample

Values less than 100 are shown as two significant figures in standard notation. Values greater than 100 are rounded to a whole number.

[1] Values from Table M-1.

[2] Values from the Infrastructure IA Report (PIONEER 2010).

[3] Values from the Parcel 4/5 IA Report (Brown and Caldwell 2015).

[4] Values from Table M-8.

[5] Detected COIs were identified as COPCs if the maximum detected concentration in (1) an on-site RI soil sample, (2) an Infrastructure IA soil stockpile sample, or (3) a Parcel 4/5 IA soil stockpile sample exceeded the soil SL for unrestricted land use.

[6] Benzo(a)pyrene, 2,3,7,8-tetrachlorodibenzo-p-dioxin, and naphthalene were used to calculate levels for total cPAHs, total dioxins/furans, and total naphthalenes, respectively, per WAC 173-340-708(8) and footnotes on MTCA Tables 740-1 and 745-1.

[7] Alkylbenzenes and non-carcinogenic polycyclic aromatic hydrocarbons are components of petroleum products that are accounted for in the TPH screening levels (e.g., see footnote 14a in MTCA Table 830-1).

[8] The six detections of the ubiquitous plasticizer bis(2-ethylhexyl)phthalate in 2007 were most likely associated with field/lab contamination rather than a Site release. As a result, bis(2-ethylhexyyl)phthalate was explicitly excluded from the COPC list in previous Site documents (e.g., GeoEngineers and PIONEER 2008; PIONEER 2009).

Table M-9: Development of Soil RLs for Soil COPCs

Soil COPCs	Soil SL for the Inhalation of Particulates Pathway in in a Commercial Land Use Scenario [1] (mg/kg)	Soil SL for the Direct Contact Pathway in a Commercial Land Use Scenario [2] (mg/kg)	MTCA Method A Soil Cleanup Levels for Unrestricted Land Uses for TPH-G and Total Naphthalenes (mg/kg)	Soil SL for the Soil-to-Surface Water (via Groundwater) Pathway [3] (mg/kg)	Resulting Soil RL [4] (mg/kg)
Arsenic	100,945	33	N/A	20	20
Lead	No Value	1,000	N/A	N/A	1,000
TPH-D and TPH-HO Combined	No Value	61,000	N/A	2.4E+04	24,000[6]
TPH-G	No Value	150,000	100	N/A	100
Total Naphthalenes [5]	12,766,544	13,333	5.0	N/A	5.0
Total cPAHs [5]	394,602	3.4	N/A	N/A	3.4
Total Dioxins/Furans [5]	11	0.00059	N/A	N/A	0.00059

Notes:

N/A: Not applicable

Soil SLs less than 100 are shown as two significant figures in standard notation, and values greater than 100 are rounded to a whole number. SLs for the inhalation of particulates pathway are shown in scientific notation.

[1] Values from Table M-3.

[2] Values from Table M-5.

[3] Arsenic, TPH-D, and TPH-HO values from Table M-6. It was previously empirically demonstrated per WAC 173-340-747(9) that all other constituents have not impacted groundwater, and therefore will not impact surface water (PIONEER 2011).

[4] Resulting soil RLs are the most stringent of the soil SLs in the previous columns.

[5] Benzo(a)pyrene, 2,3,7,8-tetrachlorodibenzo-p-dioxin, and naphthalene were used to calculate levels for total cPAHs, total dioxins/furans, and total naphthalenes, respectively, per WAC 173-340-708(8) and footnotes on MTCA Tables 740-1 and 745-1.

[6] If a TPH-D and TPH-HO combined concentration higher than the RL is encountered in Site soil in the future, the TPH-D and TPH-HO RL will be adjusted up to that measured concentration since it has already been empirically demonstrated that existing TPH-D and TPH-HO concentrations in SIte soil have not caused groundwater exceedances.

Table M-10: Benzene Concentrations in Soil

Site ID	Sample Date	Sample Depth Range (feet bgs)	Result (mg/kg)	Qualifier

Bold type face results exceed the SL.

Table M-11: Summary of Soil SLs and RLs

Soil COPCs [1]	Soil SL [2] (mg/kg)	Soil RL [3] (mg/kg)
Arsenic	20	20
Lead	250	1,000
TPH-D and TPH-HO Combined	4,700	24,000[5]
TPH-G	100	100
Total Naphthalenes	5.0	5.0
Total cPAHs	0.095	3.4
Total Dioxins/Furans [4]	0.000011	0.00059

Notes:

[1] See Table M-8 for determination of COPCs.

[2] The soil SL is the Soil SL for Unrestricted Land Use from Table M-7.

[3] See Table M-9 for the development of soil RLs.

[4] For simplicity, the soil SL and soil RL for total dioxins/furans are presented in units of ng/kg in the main text, tables, and figures.

[5] If a TPH-D and TPH-HO combined concentration higher than the RL is encountered in Site soil in the future, the TPH-D and TPH-HO RL will be adjusted up to that measured concentration since it has already been empirically demonstrated that existing TPH-D and TPH-HO concentrations in SIte soil have not caused groundwater exceedances.

Table M-12: Development of Groundwater SLs

Groundwater COPCs [1]	MTCA Method B Surface Water SL Based on ARARs and Human Health Protection [2] (ug/L)	MTCA Method B Surface Water SL Based on Environmental Effects When No ARARs Exist [3] (ug/L)	Resulting Groundwater SL [4] (ug/L)
Dissolved Arsenic [5]	5.0 [6]	N/A	5.0
TPH-D and TPH-HO Combined	1,500 [7]	720 [8]	720

Notes:

ARAR: Applicable or relevant and appropriate requirement

N/A: Not applicable

[1] The groundwater SLs for the groundwater COPCs are based on protection of surface water receptors.

[2] In accordance with WAC 173-340-730(3)(b)(i) and WAC 173-340-730(3)(b)(iii).

[3] In accordance with WAC 173-340-730(3)(b)(ii), concentrations that are estimated to result in no adverse effects on aquatic life may be established when environmental effects-based concentrations have not been established in ARARs for certain constituents (e.g., TPH-D and TPH-HO).

[4] The most stringent of the MTCA Method B surface water SL based on ARARs and human health protection and MTCA Method B surface water SL based on environmental effects when no ARARs exist.

[5] As allowed by WAC 173-340-720(9)(b), dissolved concentrations are being used to evaluate compliance for the reasons discussed in Section 6.2.1 of the *Empirical Evaluation of the Potential for Soil Constituents to Migrate to Surface Water Via Groundwater* (PIONEER 2011), which is included as Appendix C to the main text.

[6] The MTCA Method B surface water SL based on ARARs and human health protection is less than the MTCA-established natural background concentration for arsenic (PIONEER 2011). Thus, the concentration was adjusted to the accepted background concentration of 5 ug/L per WAC 173-340-730(5)(c) (see MTCA Table 720-1 footnote b).

[7] There are no ARARs for TPH-D or TPH-HO. In accordance with WAC 173-340-730(3)(b)(iii)(C), protection of drinking criteria may be used to calculate TPH-D and TPH-HO SLs for surface water human health protection since there are no surface water toxicity values for TPH-D and TPH-HO. Thus, site-specific EPH data were used to calculate MTCA Method B groundwater SLs for TPH-D and TPH-HO via MTCA Equation 720-3 as shown in Attachment M-1. Specifically, EPH data from soil sample SO-DP-57-092214-3-5 were used since that sample had the highest TPH concentration of any site-specific EPH sample. In accordance with Ecology guidance, (1) the EPH fractionated composition for groundwater was assumed to be the same as soil, (2) a non-detect EPH fraction was assigned a value of half the reporting limit if that EPH fraction was detected in any EPH sample, and (3) a non-detect EPH fraction was assigned a value of zero if that EPH fraction was not detected in any EPH sample (Ecology 2011).

[8] The Ecology Site Manager established a Site-specific concentration of 720 ug/L for protection of aquatic life at this Site (Ecology 2015a).

Work Plan	Data Gap Work Plan for Evaluating Methane in Soil Gas at the East Bay Redevelopment Site

SECTION 1: INTRODUCTION

On behalf of the Port of Olympia (Port), PIONEER Technologies Corporation (PIONEER) performed a Tier 2 methane evaluation at the Port's East Bay Redevelopment Site (Site) which is located in Olympia, Washington, on the southeast corner of the Port peninsula adjacent to East Bay of Budd Inlet (see Figure 1). The Tier 2 evaluation was conducted in accordance with the American Society of Testing and Materials (ASTM) Standard Guide for Evaluating Potential Hazard as a Result of Methane in the Vadose Zone (Designation: E2993-16). To determine whether or not methane poses a safety concern at the Site, soil gas and indoor air concentrations were measured per the Data Gap Work Plan for Evaluating Methane in Soil Gas at the East Bay Redevelopment Site (Work Plan; PIONEER 2016).[1] The results of the Tier 2 evaluation are presented in this report.

Methane is potentially a concern at the approximately 15-acre Site because the Site was built on fill material, has a significant amount of debris in some areas, and has anoxic conditions in subsurface soil overlying shallow groundwater, which is typically present from two to eight feet below ground surface (bgs). These conditions may produce methane and potentially pose a safety concern at current and future buildings and confined spaces at the Site.

This report is organized as follows:

- Section 2: Summary of Investigation Activities
- Section 3: Results, Discussion, and Conclusions
- Section 4: References

Methane is a colorless, odorless, naturally-occurring and man-made gas and is generally not toxic to humans (other than as an asphyxiant). However, methane is flammable and can be explosive under certain conditions which can result in significant safety concerns for overlying buildings and confined spaces. Historically, methane has been a concern at oil and gas fields and sanitary landfills. However, methanogenesis (i.e., the formation of methane by microbes known as methanogens) has also been observed in some anoxic environments where organic matter is present (e.g., swamps/bogs, organic fill).

[1] This Model Toxics Control Act (MTCA) Site is currently being addressed under Agreed Order DE7830.

This page has been left blank intentionally to allow for double-sided printing.

SECTION 2: SUMMARY OF INVESTIGATION ACTIVITIES

The Tier 2 investigation activities were conducted on September 12th and September 28 – 30, 2016 in accordance with the Washington State Department of Ecology (Ecology) approved Work Plan (PIONEER 2016). Copies of the field notes are included in Appendix A. A photographic log is included in Appendix B. The September 2016 investigation activities included:

- Measuring methane, carbon dioxide, and oxygen soil gas concentrations at 22 locations (see Figure 2) using a GEM2000 Landfill Analyzer. Hydrogen sulfide was also measured at each location using a BW Gas Alert Extreme H2S Model. Depth-to-groundwater was measured before measuring soil gas concentrations.
  - For locations where depth-to-groundwater was less than two feet bgs, samples were measured by installing a flux chamber six inches above groundwater (see Figure 3).
  - For locations where depth-to-groundwater was greater than two feet bgs, samples were collected using soil vapor probes (SVPs) installed by licensed drillers (see Figure 4).
- Measuring differential pressure at each sample location using a GEM2000 Landfill Analyzer.
- Collecting soil gas samples using Summa canisters at select locations to confirm GEM2000 Landfill Analyzer measurements.
- Measuring methane indoor air concentrations at the Hand's On Children's Museum and in nearby stormwater drains (see Figure 5 and Figure 6).
- Measuring methane indoor air concentrations in the restrooms at the East Bay Plaza (see Figure 6).

2.1 Deviations from the Work Plan

The following deviations from the Work Plan were identified:

- One sample location (FC-2) was added to improve coverage around on-Site surface water.
- One sample location (SVP-7) was moved due to refusal.
- Three sample locations (FC-4, SVP-12, and SVP-13) were moved due to the presence of standing water.
- Per the Work Plan, the sample locations where a sample would also be collected using a Summa canister would be the locations with the highest methane measurements. The highest methane concentrations were measured on Friday, September 30th. Typically, samples are not collected and shipped on Friday since they are sent express overnight and would arrive to the laboratories outside of business hours. Instead of the highest methane concentrations, three other sample locations were sampled[2] and the rationale for each sample is described below.
  - One was requested on-Site by Ecology (SVP-1) since it had been sampled previously and the concentrations measured by the GEM2000 were much lower than the previous concentration.
  - One was requested on-Site by Ecology (SVP-3) because it was the highest measured methane soil gas concentration on that day.

[2] One other sample location (SVP-10) was sampled but the SVP was inundated when it was pulled out. The Summa canister sample was considered compromised and the analysis was cancelled.

- One was requested by Ecology (SVP-8) because it was the soil gas sample location closest to the Hand's on Children's Museum.

2.2 Equilibration Times

Per the Work Plan, equilibration times were determined for the flux chamber samples and SVP samples. Samples were collected using the GEM2000 Landfill Analyzer and the BW Gas Alert Extreme H2S Model every hour for four hours from the first flux chamber location, and every half hour for the first hour from the first SVP location (SVP-1; see Figure 2). After the results were assessed, the equilibration times were determined to be two hours for flux chamber locations and half an hour for SVP locations.

SECTION 3: RESULTS, DISCUSSION, AND CONCLUSIONS

Since the Site may be redeveloped in the future, soil gas and indoor air concentrations were compared to the ASTM Designation: E2993-16 criteria presented in Table 1. These criteria are intended for evaluating potential hazards associated with methane in the vadose zone beneath or near existing or proposed buildings or other structures. The only buildings at the Site are on Parcels 4 and 5; therefore, the indoor air concentrations in these buildings were considered representative of site-wide indoor air concentrations. Per the criteria in ASTM Designation E2993-16, further action is dependent on three items: soil gas concentrations, indoor air concentrations, and pressure differential (see Table 1). Soil gas, indoor air, and pressure differential sampling results are presented in Tables 2, 3, and 4. The analytical reports and chain-of-custody forms are included in Appendix C.

3.1 Results

3.1.1 Soil Gas

Methane concentrations in soil gas ranged from 0% to 56% in the GEM2000 Landfill Analyzer samples (see Table 2). Methane concentrations in soil gas ranged from 1.8% to 26% in the three Summa canisters samples (SVP-01, SVP-03, and SVP-08; see Table 3). The results from the three Summa canister samples were compared to the corresponding GEM2000 Landfill Analyzer results to determine the reliability of the GEM2000 Landfill Analyzer. On average, methane concentrations measured in the Summa canisters were within 2% of the GEM2000 Landfill Analyzer concentrations. Consequently, the GEM2000 Landfill Analyzer results were considered valid for this study. No pressure differential measurements were greater than 50 Pascals.

3.1.2 Indoor Air

Methane concentrations in indoor air were 0% in the Hand's On Children's Museum and in the East Bay Plaza restrooms (see Table 4). The pressure differential could not be measured beneath the Hand's On Children's Museum; therefore, the pressure differential at the closest sample location (SVP-8) was used as the differential pressure level for the Hand's On Children's Museum.

3.2 Discussion and Conclusions

Site methane concentrations were evaluated using ASTM Designation E2993-16 criteria (soil gas concentrations, indoor air concentrations and pressure differentials) to determine if methane poses a safety concern at the Site (see Table 1). The methane concentrations for all samples except SVP-12 and SVP-13 met the ASTM Designation E2993-16 criteria for no further action (i.e., methane soil gas concentrations were less than 30%, indoor air concentrations were less than 0.010%, and pressure differential measurements were less than 500 Pascals). The methane concentrations at SVP-12 and SVP-13 were greater than 30%; however, the pressure differential measurements were 7.5 Pascals or below which indicates that methane is not a concern. No buildings are present at these locations so indoor air could not be measured.

Based on the results of this Tier 2 evaluation, methane does not pose a safety concern at the Site and no further action is required per the ASTM Designation E2993-16 criteria.

Project Name: East Bay Methane
Project #:
Workorder #: 1609693

Dear Ms. Shella Swain

The following report includes the data for the above referenced project for sample(s) received on 9/30/2016 at Air Toxics Ltd.

The data and associated QC analyzed by Modified ASTM D-1946 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free the Project Manager: Kelly Buettner at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kelly Buettner

Project Manager

LABORATORY NARRATIVE
Modified ASTM D-1946
Pioneer Technologies Corporation
Workorder# 1609693

Four 1 Liter Summa Canister samples were received on September 30, 2016. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane and fixed gases in air using GC/FID or GC/TCD. The method involves direct injection of 1.0 mL of sample.

On the analytical column employed for this analysis, Oxygen coelutes with Argon. The corresponding peak is quantitated as Oxygen.

Since Nitrogen is used to pressurize samples, the reported Nitrogen values are calculated by adding all the sample components and subtracting from 100%.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the EATL modifications.

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A minimum of 5-point calibration curve is performed. Quantitation is based on average Response Factor.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

Sample SG-SVP-10-092816 was cancelled on 09/30/16 per client's request.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.
File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Order of Magnitude Cost Estimates

This page has been left blank intentionally to allow for double-sided printing.

Table O-1: Comparison of Estimated Net Present Value Costs for Interim Action Alternatives

Cost Type	Institutional Controls and Engineering Controls (Alternative 1)	Targeted Soil Removal, Cover, and Controls (Alternative 2)	Total Soil Removal (Alternative 3)
Direct Capital Costs	$110,000	$800,000	$29,950,000
Indirect Capital Costs	$20,000	$160,000	$1,200,000
O&M Costs	$6,149	$6,149	$0
Periodic Costs	$0	$48,102	$0
Total Net Present Value [(1)]	**$140,000**	**$1,010,000**	**$31,150,000**

Notes:

O&M: operation and maintenance

See Tables O-3, O-5, and O-7 for the net present value costs presented in this table. See Tables O-2, O-4, and O-6 for the basis for Tables O-3, O-5, and O-7, respectively.

This is an order of magnitude cost estimate (i.e., +/- 50%). Since this estimate is based on a generalized description of the alternative and a variety of simplifying assumptions, actual implementation costs would likely vary as the remedial design and associated cost estimate were refined. Furthermore, since PIONEER has no control over the cost of labor, materials, and equipment or the nature of a particular competitive bidding process at the time the work would be performed, this estimate represents PIONEER's professional judgment based on experience with similar work. O&M costs are for an assumed duration of 30 years. No contingency is included in this estimate.

[(1)] Rounded to the nearest $10,000.

Table O-2: Order of Magnitude Costs for Institutional Controls and Engineering Controls (Alternative 1)

Cost Type	Item Description [1]	Qty	Unit	Basis for Quantity Assumption	Unit Price	Basis for Unit Price Assumption	Cost
Direct Capital Costs	Contractor mobilization	5	%	Assumed percentage of direct capital costs.	N/A	N/A	$4,650
	Miscellaneous implementation plans and permits	1	LS	Qty assumed to simplify estimate.	$25,000	Assumed based on actual Site costs for similar items during past Site IAs, scaled to the anticipated level of effort associated with the alternative.	$25,000
	Decommission MWs	18	Each	18 remaining MWs.	$1,000		$18,000
	Implement ECs during construction activities	1	LS	Qty assumed to simplify estimate.	$50,000		$50,000
	Sales tax	8.8	%	Current sales tax for Olympia.	N/A	N/A	$8,593
						Subtotal [2]	$110,000
Indirect Capital Costs	Remedial design and contracting support	3	%	Assumed percentage of direct capital costs based on anticipated level of effort.	N/A	N/A	$3,300
	Construction oversight	5	%		N/A	N/A	$5,500
	Sampling and analyses costs	0	%		N/A	N/A	$0
	Completion report	3	%		N/A	N/A	$3,300
	Port environmental staff	3	%		N/A	N/A	$3,300
	Ecology oversight and permit fees	3	%		N/A	N/A	$3,300
						Subtotal [2]	$20,000
O&M Costs	Inspections of cap/cover and ICs (and associated documentation)	30	Year	Assumed annual inspections for 30 year period.	$400	Assumed 4 hours/year at $100/hour for Port to conduct and document inspection.	$12,000
Periodic Costs	None	N/A	N/A	N/A	N/A	N/A	$0
						Total [2]	**$140,000**

Notes:

LS: lump sum, N/A: not applicable, O&M: operation and maintenance, Qty: quantity

This is an order of magnitude cost estimate (i.e., +/- 50%). Since this estimate is based on a generalized description of the alternative and a variety of simplifying assumptions, actual implementation costs would likely vary as the remedial design and associated cost estimate were refined. Furthermore, since PIONEER has no control over the cost of labor, materials, and equipment or the nature of a particular competitive bidding process at the time the work would be performed, this estimate represents PIONEER's professional judgment based on experience with similar work. O&M costs are for an assumed duration of 30 years. No contingency is included in this estimate.

[1] Costs for (1) excavating soil for redevelopment purposes, (2) on-site reuse of soil, (3) disposing of geotechnically unsuitable soil, and (4) constructing buildings, pavement, hardscapes, and softscapes are not included in this estimate since they are redevelopment costs.

[2] Rounded to the nearest $10,000.

Table O-3: Net Present Value for Institutional Controls and Engineering Controls (Alternative 1)

Year	Cost Type	Total Cost	Discount Factor at Assumed 5% Discount Rate	Net Present Value
0	Capital Costs	$110,000	1.00	$110,000
0	Indirect Capital Costs	$20,000	1.00	$20,000

30	O&M Costs	$400	0.23	$93
N/A	Periodic Costs	$0	N/A	$0
			Total Net Present Value of Alternative [(1)]	**$140,000**

Notes:

See Table O-2 for cost estimate details for this alternative. The base year for the estimate was assumed to be 2015.

[(1)] Rounded to nearest $10,000.

Table O-4: Order of Magnitude Costs for Targeted Soil Removal, Cover, and Controls (Alternative 2)

Cost Type	Item Description [1]	Qty	Unit	Basis for Quantity Assumption	Unit Price	Basis for Unit Price Assumption	Cost
Direct Capital Costs	Contractor mobilization	5	%	Assumed percentage of direct capital costs.	N/A	N/A	$34,900
	Miscellaneous implementation plans and permits	1	LS	Qty assumed to simplify estimate.	$25,000	Assumed based on actual Site costs for similar items during past Site IAs, scaled to the anticipated level of effort associated with the alternative. Geotextile installation costs based on actual costs for similar items at other sites.	$25,000
	Decommission MWs	18	Each	18 remaining MWs.	$1,000		$18,000
	Excavation dewatering and disposal	1	LS	Qty assumed to simplify estimate.	$15,000		$15,000
	Excavate RL soil exceedances	94	Ton	Assumed (1) 100 square foot excavations for RL exceedances at DP04, MW24S, and DP06/SVP2-SO, (2) 5 foot excavation thicknesses, and (3) soil density of 1.7 ton/CY.	$10		$940
	Haul and off-site disposal of RL exceedances	94	Ton		$66		$6,204
	Gravel borrow, haul, and backfill RL excavations	94	Ton		$25		$2,350
	Site preparation and excavation activities prior to	1	LS	Qty assumed to simplify estimate.	$50,000		$50,000
	Install geotextile under soil cover	261,000	SF	Assumed 6 acres of remaining land to receive soil cover. Qty rounded to nearest thousand.	$0.50		$130,500
	Gravel borrow, haul, and backfill for soil cover	16,000	Ton	Assumed (1) 6 acres of remaining land to receive soil cover, (2) cover thickness of 1 foot, and (3) soil density of 1.7 ton/CY. Qty rounded to nearest thousand.	$25		$400,000
	Miscellaneous cleanup requirements (e.g., ECs)	1	LS	Qty assumed to simplify estimate.	$50,000		$50,000
	Sales tax	8.8	%	Current sales tax for Olympia.	N/A	N/A	$64,495
						Subtotal [2]	$800,000
Indirect Capital Costs	Remedial design and contracting support	3	%	Assumed percentage of direct capital costs based on anticipated level of effort.	N/A	N/A	$24,000
	Construction oversight	5	%		N/A	N/A	$40,000
	Sampling and analyses costs	3	%		N/A	N/A	$24,000
	Completion report	3	%		N/A	N/A	$24,000
	Port environmental staff	3	%		N/A	N/A	$24,000
	Ecology oversight and permit fees	3	%		N/A	N/A	$24,000
						Subtotal [2]	$160,000
O&M Costs	Inspections of cap/cover and ICs (and associated documentation)	30	Year	Assumed annual inspections for 30 year period.	$400	Assumed 4 hours/year at $100/hour for Port to conduct and document inspection.	$12,000
Periodic Costs	Soil cover maintenance	1	LS	Qty assumed to simplify estimate.	$100,000	Assumed one $100,000 repair project would be necessary within 30 year period due to earthquake, flood, etc.	$100,000
						Total [2]	**$1,070,000**

Notes:

CY: cubic yard, LS: lump sum, N/A: not applicable, O&M: operation and maintenance, Qty: quantity, SF: square feet

This is an order of magnitude cost estimate (i.e., +/- 50%). Since this estimate is based on a generalized description of the alternative and a variety of simplifying assumptions, actual implementation costs would likely vary as the remedial design and associated cost estimate were refined. Furthermore, since PIONEER has no control over the cost of labor, materials, and equipment or the nature of a particular competitive bidding process at the time the work would be performed, this estimate represents PIONEER's professional judgment based on experience with similar work. O&M costs are for an assumed duration of 30 years. No contingency is included in this estimate.

[1] Costs for (1) excavating soil for redevelopment purposes, (2) on-site reuse of soil, (3) disposing of geotechnically unsuitable soil, and (4) constructing buildings, pavement, hardscapes, and softscapes are not included in this estimate since they are redevelopment costs.

[2] Rounded to the nearest $10,000.

Table O-5: Net Present Value for Targeted Soil Removal, Cover, and Controls (Alternative 2)

29	O&M Costs	$400	0.24	$97
30	O&M Costs	$400	0.23	$93
15	Periodic Costs [1]	$100,000	0.48	$48,102
			Total Net Present Value of Alternative [2]	**$1,010,000**

Notes:

See Table O-4 for cost estimate details for this alternative. The base year for the estimate was assumed to be 2015.

[1] Soil cap/cover repair assumed to occur in Year 15.

[2] Rounded to nearest $10,000.

Table O-6: Order of Magnitude Costs for Total Soil Removal (Alternative 3)

Cost Type	Item Description [1]	Qty	Unit	Basis for Quantity Assumption	Unit Price	Basis for Unit Price Assumption	Cost
Direct Capital Costs	Contractor mobilization	5	%	Assumed percentage of direct capital costs.	N/A	N/A	$1,310,750
	Miscellaneous implementation plans and permits	1	LS	Qty assumed to simplify estimate.	$50,000	Assumed based on actual Site costs for similar items during past Site IAs, scaled to the anticipated level of effort associated with the alternative.	$50,000
	Decommission MWs	18	Each	18 remaining MWs.	$1,000		$18,000
	Excavation dewatering and disposal	1	LS	Qty assumed to simplify estimate.	$1,000,000		$1,000,000
	Excavate CL soil exceedances	247,000	Ton	Assumed (1) 6 acres of remaining land to be excavated, (2) soil from ground surface to 15 feet bgs excavated and disposed of off-site, and (3) soil density of 1.7 ton/CY.	$10		$2,470,000
	Haul and off-site disposal of CL exceedances	247,000	Ton		$66		$16,302,000
	Gravel borrow, haul, and backfill CL excavations	247,000	Ton		$25		$6,175,000
	Miscellaneous cleanup requirements (e.g., ECs)	1	LS	Qty assumed to simplify estimate.	$200,000		$200,000
	Sales tax	8.8	%	Current sales tax for Olympia.	N/A	N/A	$2,422,266
						Subtotal [2]	$29,950,000
Indirect Capital Costs	Remedial design and contracting support	1	%	Assumed percentage of direct capital costs based on anticipated level of effort.	N/A	N/A	$299,500
	Construction oversight	1	%		N/A	N/A	$299,500
	Sampling and analyses costs	1	%		N/A	N/A	$299,500
	Completion report	0.5	%		N/A	N/A	$149,750
	Port environmental staff	0.25	%		N/A	N/A	$74,875
	Ecology oversight and permit fees	0.25	%		N/A	N/A	$74,875
						Subtotal [2]	$1,200,000
O&M Costs	None	N/A	N/A	N/A	N/A	N/A	$0
Periodic Costs	None	N/A	N/A	N/A	N/A	N/A	$0
						Total [2]	**$31,150,000**

Notes:

CY: cubic yard, LS: lump sum, N/A: not applicable, O&M: operation and maintenance, Qty: quantity, SF: square feet

This is an order of magnitude cost estimate (i.e., +/- 50%). Since this estimate is based on a generalized description of the alternative and a variety of simplifying assumptions, actual implementation costs would likely vary as the remedial design and associated cost estimate were refined. Furthermore, since PIONEER has no control over the cost of labor, materials, and equipment or the nature of a particular competitive bidding process at the time the work would be performed, this estimate represents PIONEER's professional judgment based on experience with similar work. O&M costs are for an assumed duration of 30 years. No contingency is included in this estimate.

[1] Costs for (1) excavating soil for redevelopment purposes, and (2) constructing buildings, pavement, hardscapes, and softscapes are not included in this estimate since they are redevelopment costs.

[2] Rounded to the nearest $10,000.

Table O-7: Net Present Value for Total Soil Removal (Alternative 3)

Year	Cost Type	Total Cost	Discount Factor at Assumed 5% Discount Rate	Net Present Value
0	Capital Costs	$29,950,000	1.00	$29,950,000
0	Indirect Capital Costs	$1,200,000	1.00	$1,200,000
N/A	O&M Costs	$0	N/A	$0
N/A	Periodic Costs	$0	N/A	$0
			Total Net Present Value of Alternative [(1)]	**$31,150,000**

Notes:

See Table O-6 for cost estimate details for this alternative. The base year for the estimate was assumed to be 2015.

[(1)] Rounded to nearest $10,000.
